HELP.... We have a two meter (146 MHz) Amateur Radio repeater to repair. The manufacturer wants full commercial prices, and will only sell us the "whole module" at full commercial prices instead of selling us just the parts we need to repair the Power Amplifier.

We need to repair our Aerotron 60BT100R transmitter. The finals in this 100 Watt unit have destroyed themselves, and in the process destroyed the printed circuit board.

Since the commercial world is expensive (almost $500.00 to replace the whole module), and they will NOT consider selling us the parts to repair our Power Amplifier module, I am looking to the NET to help our repeater group out (Yes, this is to support an OPEN repeater).

The final transistors are made by CTC and are part number BM70-12, we need TWO (2) of these. I am told that these are no longer in production, and are very hard to locate.

If you have, or know anyone who has connections that might be able to help us, please contact me!!

We are looking for any or all of the following:

(quantity 2) CTC BM70-12 power transistors.

Circuit board for the Aerotron 60BT100 Power Amplifier strip.

Used (or new) 60BT100 Power Amp strip (we will consider a lower
power strip also), this is the 146MHz unit (VHF range A??).

I too love my 02AT that I bought 2nd hand as my first 2m HT.

Could someone please pass along the mod for the above mentioned receiver coverage?

Thanks.

This is not so much STRANGE as interesting.

We gave a NOVICE exam a while back and the guy got his call:

KB5MIJ

As he was pondering phunny phonetics, the best he had discovered
to date had been "Made In Japan". I pointed out that the last
three letters were quite significant-- if run backwards!

His name is JIM.

There is a lady in North Carolina (she and her OM are formerly from 8-land,
West Virginia) whose call is wD8EBI and her name is DEBBI.

Her 610 went in with a stack from a Novice/Tech class at the local club.

What's the probablility that hers fell right without help?

Twas I John. Hook the unclamped baseband video on your IRD up to your HF rig and I would suggest about a 30 DB pad in the middle. The bird is Spacenet-3 (S-3) transponder 17. The emission is FM and I suspect it is around 20 KHz deviation because I am clipping a little bit using the standard 10 KHz bandwidth found in most amateur rigs in FM mode. The images are sent in APT mode usually using HF modes of 120 lpm and a IOC that matches HF also. I have heard them shift to 240 lines per minute on occasion. The freqs. are around 1.5720 Mhz for the charts and 1.8840 and 1.9315 Mhz for the GOES WEST and GOES EAST images respectfully. They use the standard start and stop tones also.

I was trying to work NPG, Saturday afternoon on 20 Meter RTTY, during Armed Forces Day. Although he heard me once, we didn't manage to have a proper `exchange'.

A question came to mind. With NPG transmitting (just below the bottom end of 20 Meters) `upside down' (ie. his mark-space frequencies were inverted, as compared to amateur radio practice), was he listening `inverted' also?

My second question is, when a military station announces "listening on 14.080 MHz", does he expect to find our mark (or space) carrier on that frequency or, should we `straddle' it? I believe that its been an accepted practice, among hams, to refer to the `mark' frequency, when it's necessary to specify frequency. What are the accepted military/commercial standards? Is this sort of thing specified in some CCIR publication?

Any thoughts on this subject would be appreciated.

Please reply to (InterNet) "nix%muppet.decnet@consrt.rok.com".

I was unable to respond directly to the person interested in this antenna.

Therefore: Check out the March 1990 issue of CQ magazine, pp. 32-33 for and article by Lew McCoy W1ICP.

Lew seems impressed by the antenna, and comments that the DX-VI works out very nicely from 80 through 2 meters! Yes, it works well on 6 and 2 meters as a bonus.

Check it out.

Not always... There is a guy who works here who didn't even get a call sign when he became a ham. His brother was already a ham, and at the time (late 30's?) the FCC would not issue a second station license for the same address. So he just got the operators ticket and no station until his brother moved out.

If you can find out which node on the computer has this harmonic, you could soften up the signal edges with a small capacitor. Either find it with a signal strength meter with high pass filter, or look on the schematic for a clock line that may be overdriven.

A friend of mine has about 20 Motorola P-10 Handhelds, all crystalled
the same and all with Chargers, Antennas, etc... He is considering
selling them however he would like to get a feel for how much people
would pay for them. These are all brand-new units with 2 year
warranties.

If you are interested in them please send you mail to my address and I
will forward it to him. Please no UNREASONABLE offers, he does not need
to sell these units.

Lance Ware

Yep, you sure can. In fact, I did just that. Since I didn't have _any_ license at all when I walked into the test, I had to wait for the FCC to be able to transmit. (There is no "temporary KN for novices!) If you already have a license, you'll get a temporary authorization to use your new privs.

Congratulations!

>you may have had with the Challenger DX-V and/or DX-VI Antennae from
>Gap Antenna Products of Vero Beach Forida,

The antenna is basically a half-wave vertical on 20 meters with additional stubs to provide matching on other bands. I gave it a look at Dayton a few weeks ago, and my friend N2EA bought one and erected it as described in the instructions sheet. The antenna works very well on 20 meters, but is a complete wash out on the other bands. 40 and 80 are particularly dissapointing.

I would find the room for radials and put up a Butternut if you want to go with a vertical.

I'm looking for a Canadian supplier of a film known as
TEC-200. This is a thermal-transfer film that can be used
to produce "iron-on" PCB artwork. Anybody know who manufactures
this stuff?

```

This 'enquiring' mind Xray'd the damn thing. It appears to have a voltage
regulator, a four bit CMOS counter, and some misc analog voltage/drive
looking components. The counter is of the presetable variety and you can
see traces on the board where cuts have programmed the devide by ratio
of the counter. Our guess is one data line sets the clock, another line

strobes it, and the program reads the devided clock on yet another line.
We think all of the analog stuff kills this clock circuit when the
data strobe is asserted. We haven't tried to defeat it. Since we're a
large corporation, we just buy more keys. Luckily, inquiring minds run
the Xray equipment.

I have a Dodge caravan and a garage with a fairly low door.
I want to install a permanent 2M antenna on the Caravan.
The mag mount gets knocked over and scratches the roof.
Does anyone have any success stories or recommendations?

Thanks in advance.

It's bad enough to be invaded on 10m by taxi drivers, but while slumming
on 20m last evening (a little after 0600Z), I came across a sideband signal

at 14.084 MHz. Sideband at 14.084? Moreover, it is *lower* side-band. Now, what self-respecting Ham would do that? I got curious and listened. Sounded like a bunch of stations (at least 3) conversing in what seemed to me to be the Hakka dialect of Chinese. They were yakking away as if they were on cellular telephone or something. The strongest was coming in with a good S9. Quite likely to be fishermen in the Pacific. Certainly not Hams.

It gets more interesting. When I tuned across again about half an hour later, there is this "fake" CW station trying to jam them. Well, I say "trying" because this lid was at absolute zero beat with them. HI. Didn't do squat to QRM them. He/she was also sending gibberish CW (hey, my morse ain't *that* bad to not be able to read proper CW :-). But, now and then, a couple of CQs and VVVs got through. Smoking gun. A fellow Ham almost for sure. For a while, I though I heard an RTTY signal on top of them, too. But, at that frequency, it could be a legitimate one who wasn't aware that he was sharing the spectrum in an intimate fashion. Anyway, the CW jammer finally wised up and started to sweep slowly back and forth across the LSB signals -- that finally drove the non-hams away.

So. We are not supposed to cause malicious interference. But, has the FCC interpreted whether this applies to interference to a service that is not supposed to be there in the first place? If so, how does one get rid of these strangers?

Would be interesting for 3D2AM to say "listening 14,084, plus minus 5."
:-) :-) :-).

Is TEC-200 film any different from the normal overhead transparency film that one feeds into the hopper of a copier, like Folatran X-100? (not the stuff you combine with a paper copy and put through a thermal transfer machine).

Has anyone tried to use this film to make iron-on PWB resist?

     I heard *somewhere* that TEC-200 is just a special type of
     transparency film for copiers. Not a special one designed

just for PCB work; just one of the ones that happens to work well. Can't remember where I saw this, but you might want to try it. Post results if you do.

I was just there this last Easter vacation. The only two repeaters I could bring up (I believe) were 19-79 and 34-94, both in Carlsbad. Both have the capability to link into the Zia Network, which covers much of New Mexico, part of Texas, and Arizona. However, nothing (as far as I could tell) would reach to Guadelupe NP. I even double-checked with some locals in the area. The exception might be if you climb up to the mountain tops.

Help ! After serving me faithfully for 8 years, my Butternut HF6V antenna has given up a few key parts to midwest winters. The owners manual lists a phone number that now belongs to a Texaco gas station. If anyone can send me the

correct phone and/or address, I would sure appreciate it. Directory assistance
does not have any listings for them.   tnx in advance.

Yes, indeed. 30-54 disappears when you install D-9. I just pulled
mine out last night. None of the instructions I saw mentioned this.

As a newcomer to ham radio, I am looking for some advice on purchasing
my first rig, a 2m HT. I want to start with a couple-year-old used one

----

A few more opinions:

* By now you have noted that folks are pretty opiniated on the merits of various rigs. The ideal feature set/user interface varies a great deal with the speaker. The technical issues are a bit more concrete. If someone has actually tested a radio and found it lousy then its probably lousy and overrides thousands of comments of "I've never had a problem.")

* I would suggest that EVERY radio mfg has introduced a dog a one time or other. But generally ICOM, KENWOOD & YAESU have all built some fine radios.

* Power output: most folks I know leave their HT's on low power due to battery life considerations. Most repeaters in Colo do just fine with fairly low power. The exception might be the "HT in the car" mode. First action there is an external antenna. Along these same lines I vote for multiple small battery packs rather than one big one. Keeps the HT size down and allows you to recharge one pack while using the other.

* Memories: try to get an HT that remembers the offset in memory. Some of the older ones (Yaesu FT208R, for example) require you to muck with the offset control every time you switch memories.

* The IC2AT is a fine radio, but doesn't have memories.

The wide-band radio shack scanners use a UHF local oscillator (~750-... MHz), and ~610 MHz first IF. Since this 610 is also the first IF in standard cable TV converters, this is probably not a coincidence. Thus, if you try to receive in this frequency range, you run into problems - both LO frequency stretch, and feedback between front end and IF.

I want to purchase a 2m mobile rig that will serve as a rig for the car (my home away from home) and a radio to support packet. The rigs that I am considering are the Kenwood TR751A, Yaesu FT290R, and a used Icom 255A. I will appreciate any feedback I can get concerning these rigs, or any others that any of you might think worthy of consideration, but are not on my list. I would prefer the "all mode" feature, but it isn't a necessity. I will gladly summarize my results, and repost in a few days. Thanks in advance for any and all assistance!

In the last radio telescope I worked on in Japan (34 Meter dish in Kashima, completed late last year) they used a hydrogen maser to provide a 10 MHz reference for things like downconverters. Unfortunately, they had only one located about 700 Meters away from our dish, and ran it out on some cheapo coax (RG-58, I think) that was quite prone to the 50 Hz power line frequency used locally. REALLY screwed up the maser purity. The local oscillators wouldn't lock because the PLO's weren't getting a stale frequency. They also used the dial up 'phone time' to set all their clocks for pointing the telescopes. Seemed kind of wierd, after dropping $10M on the telescope, but I guess it works for them.

Just thought you might get a chuckle from this info.

  Sb: speeding up Uniden 2510 AGC
```

For those of you who are using a Uniden 2510 for packet, you can speed up AGC speed considerably, just by removing the AGC SSB switch transistor Q-111 This transistor switches the AGC off for CW operation, and on for SSB operation. All I did was remove it and my radio now works with very good speed on 10m. You may put a switch between the pads that were for collector and ground. When you want slow AGC turn the switch ON pulling line to ground. For fast agc turn switch off leaving line floating. That is all there is to it.

The description of the mod for the 2510 may work for the 2600. Those who have the Uniden 2600 may find that the AGC is the same for this radio. Look for NJM2902 IC (this is the AGC amp), you may find a transistor connected thru a RC network, to pin 12 of said ic. Remove also. (this mod not tested!)

The 60 kHz time transmissions are WWVB, which is believe is very similar in format to the transmissions from WWV or WWVH on 2.5, 5, 10, 15, and 25 MHz. All are run by the NIST (formerly NBS); WWV's transmitters are right here in good ol' Ft. Fun, Colorado (if I stand up and look north right now, I can just make out the antenna farm!). WWVH is near Kehaka, Dauai, Hawaii.

These stations supply VERY accurate time and frequency information; not only is the carrier on-frequency to within an inch of its life, but the various beeps, clicks, and other tones used in the transmissions are similarly accurate. (For example, the tone at the top of the minute is EXACTLY(tm) 1kHz.)

The time is also encoded in a BCD format on a 100 Hz subcarrier.

My 1981 copy of the ARRL _Radio_Amateur's_Handbook_ has a one-page diagram outlining the format, and I suppose that you could find this information in later editions as well. Or, simply write to:

Radio Station WWV
2000 E. County Rd. 58
Ft. Collins, CO 80524

Another station which provides a similar service is CHU, operated by the Canadian government on 3330 kHz, 7335 kHz, and 14670 kHz. They also provided encoded time information (although theirs is in a different format). Unfortunately, I do not have an address for CHU information.

There used to be a Heathkit clock which used WWV's time codes to keep itself correctly set, and I believe an RS-232 interface (or some such) was available as an option; I don't know if they still make this or not, but it or similar commercially-available products might be just the thing for unattended operation.

> This isn't a flame, just want to make sure you have all the
>potential disasters in mind...

Certainly I have taken precautions so that non-hams will *not* have access
to this system. There is a logon procedure which will only allow users which
have been registered to use the system. People without ID's and PW's are not
told anything, they are just hung up on. Basically, it's a closed system. Only
the people who I've given access to manually can get on.

My real concern is whether or not it this considered legal operation of my
station. If my friend dials in, logs on, changes mycall, and uses my station
under his call, is it the same as him coming over to my place, sitting down
at my computer, changing mycall and making a contact? I believe that through
my interpretation of the rules, this is legitimate. What do you think?

I urgently need a schematic diagram for an old Henry Radio Tempo fmh-2
handie talkie. I had been using this for packet work, but it died.
It doesn't look too tough to work on, but without a diagram ...

I will be glad to pay for copying, or reasonable price for original, and
postage.

Please reply via E-mail or packet:

asuvax!xroads!kjustice
or
KF7TP@W1FJI.AZ.USA.NA

Thanks for anyone who can help!!!   Keith

Compiled by K4ON from May, 1990 QST

Last year I went out to Fort Lewis, Washington (near Tacoma) to operate the Army MARS station there. Quite impressive! For some reason, I pictured a small station with old gear tucked into the back of a Quonset hut somewhere. What I found was a LARGE antenna farm that definately looked like a high-powered HF military station. There was a nice building with a separate room for each operating position. I got to operate some very nice Harris mil-spec high powered HF radios into some huge log-periodics and wire arrays. It was fun working cross-band on all those weird frequencies.

Why do you need such an accuracy? With a clock that is only 0.001s accurate, you can achieve a pointing accuracy of 0.015 arcsec.s, which is much less than the errors introduced by telescope flexure and atmospheric conditions. At McDonald Observatory we automated our 36" telescope with a clock that has about the same accuracy as the Heathkit 'most accurate clock'. The system puts the object on the cross-hairs every time. We are currently looking to port this system onto our 107", 82" and 30" scopes also.

A clock with only millisecond time accuracy can also serve as the time standard for your insturments. VERY rarely do you ever need a more accurate time than a millisecond in astronomical data collection.

PRODUCT REVIEW: ICOM IC-228H 2M TRANSCEIVER

by Bob Parnass, AJ9S

My Icom IC28A performed very well, and giving it to my wife afforded me the opportunity to buy another 2 meter radio.

What do I look for in a 2 meter transceiver? Being a scanner enthusiast, I look for wide frequency coverage on receive, and reasonable scanning facilities. Reliability and ease of obtaining schematics and parts are important, and Icom, Kenwood, and Yaesu score well here.

I prefer 25 watt radios to 45 watt radios for a few reasons:

1. I believe manufacturers overrate their transmitters' power specifications. Most models use hybrid modules for the driver/final amplifier stage. As a recent QEX article points out, the hybrid modules are only 25% - 50% efficient, which means the bulk of the power is dissipated in the form of heat.1

   The heat sinks on today's radios are just not big enough to dissipate the kind of heat developed during my typical QSO (conversation). The heat sink on my old 25 watt Motorola MetrumTM never got nearly as hot at the heat sinks on late model 25 watt Japanese radios. My 25 watt Kenwood TR-7800 and IC28A became very hot during QSOs. Pity those who bought Kenwood's "45 watt" TM-221A transceiver. It's not until they read the owner's manual that they learned Kenwood recommends against transmitting for more than 1 minute out of 3.

   Heat shortens the already finite life of the hybrid modules, and I've been forced to replace these modules on various radios, to the tune of over $55 apiece (not including my labor).

2. It's easier to find power supplies for 25 watt radios, because they require only 6 - 7 amperes, versus 9 - 10 amperes for their 45 watt counterparts. The smaller power supplies are less expensive and are easier to find surplus.

3. Signals from 25 watt transmitters are almost as strong as those from 45 watt radios.

The IC228A/H series is Icom's replacement for the IC28A/H two meter radios. The tradition of offering two models at different transmitter power levels continues, with the 25 watt IC228A and 45 watt IC228H.

The IC228 contains a single VFO, and 20 memory channels. All the memory channels behave the same, as contrasted with some Kenwood designs which limit the flexibility of certain memory channels, while permitting special operations with others. Each IC228 memory channel can store receive frequency, CTCSS tone, transmit frequency offset, and scan list lockout.

Unlike Yaesu radios, the IC228 comes equipped with a synthesized CTCSS (PLTM) tone encoder, which is almost a necessity for using repeaters in the Chicagoland area. Any one of 32 tone frequencies can be selected from the front panel, and associated with a memory channel or VFO.

Repeater offsets are selectable from 5 KHz through 10 MHz, and can be stored in memory. You could conceivably store 20 different repeater frequencies in the IC228, each with a different offset and tone.

I wanted the 25 watt IC228A, but only IC228H models were available at the time. I'm glad I bought the IC228H high power model, because an internal potentiometer made it easy to reduce power output from 45 watts down to 25 watts. The large heat sink affords extra cooling capacity, and the final amplifier should last longer. Even so, the heat sink becomes too hot to hold during a moderately long QSO! Heat is eventually transferred from the heat sink to the entire radio case, making the entire radio "untouchable."

The major changes in IC228 circuitry from the IC28 design involve the microprocessor. The RF circuits remain similar, using the same transistor lineup in the transmitter stages and the now familiar Motorola MC3357 IF detector/squelch chip popular in scanners.

Icom took cues from the Kenwood TM2530 series to improve the LCD display panel and make the front panel controls visible in the dark. The display on the IC228 makes use of colored backgrounds for various fields, and is easier to read than the display in the IC28.

Unlike the IC28, the IC228 emits a beep tone each time a key is depressed. Although some people find this feature annoying in walkie-talkies, the beeps make it more convenient to operate the IC228 while driving. Icom recognizes freedom of choice, and permits the user to disable the beep.

The volume, squelch, and tuning knobs, as well as several buttons, are now backlit - an improvement over the IC28. The IC28 contained a photocell which automatically varied the LCD backlighting with changing ambient light levels, however the newer IC228 permits the user to select from 4 fixed levels of backlighting.

There is no free lunch, and Icom fans had to give up something in exchange for the new control backlighting: the plastic front panel and tuning knob on IC228 feel chintzier than the metal panel and rubber padded knob on the IC28.

Another new feature is a "lock" pushbutton, which disables the radio's front panel controls. I haven't found this as useful as the lock slide switch on the DTMF up/down microphone. The up/down pushbuttons on the microphone can be bumped accidentally in the mobile environment, and the slide switch prevents unplanned frequency changes.

The IC228's scanning features are on par with, or slightly above those of other 2 meter transceivers, but not as well implemented as in "real" scanners. The IC228 scans at the same speed as the 28 - rather slowly. A reasonable memory scan, with channel lockout, is provided. This is an improvement over the early Kenwood TH-215 walkie-talkie memory scan, which lacked a lockout feature, so one was forced to scan ALL channels.2

The timer operated scanning in the IC228 causes the radio to resume scanning 2 seconds after the carrier drops, or after 15 seconds - whichever occurs first. Too bad the IC228 lacks a carrier operated mode, like the feature in the Kenwood TM2530, so the receiver would "stay put" until the carrier drops.

The IC228 includes the ability to search between 2 frequency limits, and users of the American versions can select tuning steps of 5 KHz or more. The search limits are programmed into a special register pair, so they don't tie up memory channels. The search will pause as soon as the squelch opens, which usually brings the receiver to a halt off the center of the station you want to hear. Unfortunately, Icom didn't adopt the Kenwood "center tuning" or Bearcat ZeromaticTM feature, which forces the searching to stop right on the center frequency. The Bearcat window detector circuit employs operational amplifiers, fed by the discriminator signal, to generate a logic level when the receiver is tuned within 2.5 KHz of center frequency.

When the IC28 was first introduced, it was offered with either the standard or DTMF microphones, at two different prices. Apparently, most people wanted DTMF mikes, and a DTMF microphone is provided with the IC228.

Except for the high heat sink temperatures, the IC228 performed well during a recent cross country trip. With the radio bolted to the center console of my truck, the receiver audio output was ample, the display easy to read day and night, and stations in Pennsylvania and Ohio praised the transmitted audio quality.

I'm pleased with the IC228, and recommend it.

---

1. See "RF Hybrid Modules: Building with Bricks," by Bill Olson W3HQR, in July 1988 QEX.

2. Late vintage Kenwood TH-215 walkie-talkies now come with upgraded firmware which permits channel lockout. A new CPU chip may be retrofitted into earlier units, but Kenwood charges for this service.

Some of the above reply is not quite correct. The NBS (now NIST) transmits HF time signals on 2.5, 5, 10, 15 and 20 MHz from Ft. Collins, CO (WWV) and Kauai, HI (WWVH, omits 20 MHz). They also do indeed transmit a time signal on 60 kHZ (WWVB, in Ft. Collins, CO). WWVL was a 20 kHz station at the Ft. Collins site but was shut down 20 years ago. In addition to this, NIST transmits a time code on the interrogation channel of the GOES satellites, this at slightly above 468 MHz. All this is from NBS Special Publication 432.

While the WWV(H) time signals are certainly very accurate as transmitted, HF signals propagate by F-layer skip which means the transmission path length will vary somewhat unpredictably from day to night, summer to winter, and with changes in solar activity. The time you receive will thus jitter by something on the order of several milliseconds. Also, since HF propagation is fairly unreliable, you will need a reasonably stable oscillator backing the receiver for periods when the time signal is unreceivable.

Heathkit does make a clock to receive the WWV(H) time code (which is modulated on a 100 Hz subcarrier, you can hear it if you turn up the bass on your radio), and it is cheap, but it is also incredibly poorly done. The time code from the serial port only gives you the time to one decimal place after the seconds (i.e. 100 ms), you have to guess at the rest. Worse, if the receiver loses the time signal (which it will, this is HF radio) the time will sail off into never-never land with no indication that all is not well. A well-done WWV(H) receiver with an RS-232 interface is sold by

Traconex Inc.
1140 N. Kraemer Blvd, Ste. G
Anaheim, CA 92806

but this is probably not a big volume item and is quite pricey (I think $1200 or so). This will provide time to within a few milliseconds of UTC under most conditions.

Because low frequency radio is less affected by ionospheric variation (it propagates using the earth's surface and the ionospheric D-layer as a wave guide), WWVB will in principle give you accuracy better than 500 us, and perhaps as good as 100 us. There are a number of companies which sell WWVB receivers, including

Spectracom Corp.
101 Despatch Dr.
East Rochester, NY 14445

Kinemetrics/Truetime
3243 Santa Rosa Ave.
Santa Rosa, CA 95407

but if you don't like the price of the Traconex receiver you aren't going to like these at all. Note also that if you really need 300 us time at all times you would probably want to back these radios with a good quality ovenized crystal oscillator to cover periods of signal dropout (though this is less of a problem at 60 kHz than at high frequencies), so add another $800. Kinemetrics (among others) also makes a GOES receiver for even better accuracy and reliability, but at correspondingly higher prices.

If these are outside your budget but you don't mind doing some soldering and you are located close to the east coast you might look at the CHU time signal instead, at 3330, 7335 and 14670 kHz. You can build a quite decent receiver for the timecode with a consumer HF radio and a well-filtered 300 bps modem (the latter you might have to construct). Carefully done, this can give you the precision of the Traconex receiver during periods when the signal is recievable, though to match the reliability of the Traconex you'd need a radio receiver which allows computer control of the frequency (this puts the price up) and this will still only give you several-millisecond precision. Homebrewing a WWVB receiver from scratch would actually be a fair bit easier and cheaper than WWV/CHU if you are into LF radio receiver design, but would still be in the category of major project.

I think the upshot is that there is currently no cheap way to buy a time code receiver which is accurate to 300 us, and no easy way to build one. Milliseconds are cheaper/easier to come by, but still pricey. The Heathkit radio is cheap but I wouldn't trust it for more than setting my watch and even then I'd want a second opinion.

If you've got a few years to wait, however, I'd watch the price of GPS receivers. Even the degraded version of GPS that non-military people get to use should be able to provide microsecond timing (it has to to provide the positional precision it does), and now that there actually exist some GPS satellites I wouldn't be surprised to see the price of these receivers eventually fall to not much more than that of a good quality scanner as volumes increase. This is definitely a future item, though, as the price of current GPS receivers is absolutely frightening.

I'd like to know if the Kenwood RC-20/IC-20 remote head/interface will
permit crossband repeat when used with the tm-231, 331, 431 ect.

Thanks!
Noel

I am curious about the origin of the FOC CW operators and how one
goes about securing sponsorship to become a FOC.
What are the criteria for selection of FOC members?

At 60 khz, the WWVB carrier cycles every 16.67 usec. The best resolution
you can get would be at least 1/4 of that and possibly even better. The
hitch is knowing the propogation path delay between you and the WWVB
transmitter site. While the distance can be calculated very accurately,
I'm not so sure there are no propogation effects that need to be accounted
for. But the WWVB signal does not have the regularly changing effects
you would see at HF frequencies. Also, 60 khz is easier to digitize and
do some slick stuff with than 5 Mhz.

Given the on-going interest in this newsgroup about Numbers stations and related shortwave mysteries, I am posting the following announcement of publication.

Announcing THE NUMBERS FACTSHEET, a quarterly publication compiled and edited by the acknowledged authority on Spy Numbers Stations, Havana Moon. Nobody knows Numbers like HM - and nobody does Numbers like HM.

This hard hitting newsletter covers Numbers like no other publication out there and includes the following:

- Unusual Intercepts
- Little Known Facts
- Book Reviews
- Articles by Numbers Experts
- An Intercept Database Sorted by Time and Frequency
- Commentary by Havana Moon

THE NUMBERS FACTSHEET is available from MoonBeam Press, PO Box 149, Briarcliff Manor, NY 10510 at an annual subscription price of $16.00

domestic, $25.00 international air mail.

A sample copy is available for $1.00 to cover the cost of postage and handling.

The carrier is dropped in power by 10 db at the beginning of every second, and stays down for 200, 500 or 800 ms depending on whether the bit is a 0, a 1 or a marker, respectively. A marker is sent every tenth second, with a pair of them at seconds 59 and 0 of the minute. The other bits encode the time, date and some other junk, in BCD.

A receiver which does a good job of decoding this can be a fairly simple thing. Phase lock to the 60 kHz carrier and use the output of the PLL as a detector for the amplitude changes. This gives you both the time code and a nice, accurate frequency source.

Since I started this thread, let me ask another question about packet systems.

As I understand it, the packet network exists because when a packet is broadcast, any other node which receives that packet and finds that it is not addressed to them, rebroadcasts that packet. (Digipeater?)

If this is so, than it seems to me that unless the operator of each repeater is verifying each packet sent out over his transmitter, than he is in essence doing just what some people were commenting on: the ability to resend mail addressed to a packet site which originates on a land-line based network (ie. uucp or internet).

By the way, aren't there restrictions on the types of things which can be posted on some machines in the internet? Like advertisements?

In article <998@gold.GVG.TEK.COM> grege@gold.GVG.TEK.COM (Greg Ebert) writes:

> NBS transmits 5, 10, and 15 (or is it 10, 15, 20 ?) Mhz signals which
> are reputed to be THE time standard. Broadcasts are from Boulder, CO,
> (WWVB), Hawaii (WWVH), and Idunno, (WWVL).

Actually, NIST transmits as follows:

WWV	(Fort Collins, CO)	5000, 10000, 15000 (*)
WWVH	(Kaui, HI)	5000, 10000, 15000 (*)
WWVB	(Fort Collins, CO)	60

Frequencies are in KHz. The entries flagged with a (*) may also transmit on any or all of 2500 and 20000 KHz - it's been a while since I checked :-) NIST used to operate a station on 20 KHz (WWVL). It was shut down a number of years ago. You can also get the time broadcasts over the phone. No, I don't have the number.

There is quite a bit of "other stuff" encoded in the transmissions. A call to NIST will scare up various bits of documentation on the formats used.

There are quite a few LF time stations in operation. Following is a repeat of a posting documenting some of them.

Dongle, now there's an interesting term.  Banyan uses them on their servers
and just called them 'keys'.

I can't speak for the ones need on the Amiga but I would imagine the ones
used by Banyan were a little more complex than just jumpers because they
hook up to the printer port (paralel) and don't interfere with the normal
operation of the printer.  I had always assumed they had enough smarts to
return an answer when queried about their status.  Then all the software
has to do is read/write the printer port.

Anybody got more info??  Anybody from Banyan out there??

Inquiring minds want to know!!!

Ok... now I have a few questions:

1) What the heck IS a dongle?? I'm and Apple person myself, and at first though
t it was a joke... but apparantly not.

2) Why did they give it such a silly name?

I would like to know is there any harm in connecting an external wire
antena (to be used with a SW radio) to a TV antena which is on the top
of our apartment complex. By doing so it improved the signal strength
to some extent but it sounds like either the circuitary is generating
static or the antena is overloading. However if I connect the same antena
to an adjacent(to TV antena) chimney, the overloading/static disappears.

At a recent hamfest, I acquired for a *very* reasonable sum a simple RTTY setup consisting of AEA CP-100, an MFJ crosshair tuning aid, monitor, and (here's the laugh(?)) a Model 2 TRS Coco, complete with ROM software cartridge. It serves me just fine, *except* that the ROM cartridge is sorely lacking in features; I'd like to tinker with the system and do better.

My question for the net is: (1) Does anyone have or can tell me where to get an assembly/tech manual for the Coco 2 so I can write my own demod code and chuck the ROM? (2) Does anyone know of a *good* ROM cartridge that existed for the Coco 2 for RTTY? (I don't care if it doesn't have AMTOR) Or even a good piece of software?

Any answer is helpful. I just want to tinker and have maximum fun on RTTY for my small investment.

Tnx,
Len

A factor that must be considered when using accurate time sources for telescope pointing is the slightly irregular rotation rate of the earth due to seasonal movements of water and the atmosphere. (These movements cause small changes in the earth's moment of intertia. Since angular momentum must be conserved, the earth's rotation rate must change to compensate.)

UTC is based on atomic clocks that are much more stable than the earth's rotation, so much more so that UTC has to be adjusted occasionally to keep it within a second of "earth time". This is the reason for the "leap seconds" that you hear so much about at the end of most years. The difference between UTC and UT1 (or "earth time") is encoded in a series of double ticks at the beginning of each minute on both WWV and CHU. These codes only have a resolution of 100 ms, so even if you knew UTC precisely you could point your telescope to a given point on the celestial sphere to a peak-to-peak error of 1.5 arc-seconds along the right ascension axis. Given that this is about the resolution of the best ground-based telescopes, I wouldn't worry about this level of error.

Phil

A time standard for an automatic observatory must deal with radio propagation delays AND changes in the official definition of time itself (i.e. leap seconds). This unfortunately is not a joke...

I winter-overed at the Amundsen-Scott South Pole station during the 1982-83 season as a support scientist for various U.S. National Science Foudation research projects. My partner and I had to keep all the clocks of the instruments in the Skylab building accurate to within 10 ms. We would manually set the time standard by monitoring the time signal with an oscilloscope on the back end of our radio receiver.

The South Pole station was effectively cut off from the rest of humanity for about six weeks during the depths of the austral winter (June-July) when we could not receive any radio signals at all. After we rejoined the world and could once again receive radio signals, my partner and I decided to check the clock... We were shocked to find that all our clocks were precisely off by 1.000 +- 5 ms from UT! A leap second had occured and we had not been warned. Sigh...

So the upshot is that the definition of time itself can change and a truely automatic observatory must take this into account. A SEMI-automatic observatory would, of course, not have to worry about leap seconds.

Yours in the pursuit of accuracy and precision,

Ken Mighell

I went to a few dictionaries to check for a kosher definition and found nothing. It may be in the latest and greatest OED, but I don't have that one.

The first official reference I recall for the term dongle was used in reference to the Sinclair QL computer (What dat?).

By the time Sir Clive and chums had got all the circuitry together, it no longer fit in the spiffy case. So they had a little box hanging off the back with the extra parts in it. This was referred to in the press as the "dongle board".

The QL and its dongle board have disappeared into computer history, but apparently the term dongle lives on

I looked at the word "dong" to see if it was derived from that. I assume not, dong means to hit or strike in Aussie slang, a small aluminium coin in Vietnam and of course a penis as John Steinbeck noted in the Grapes of Wrath. I would say that dongle is just an amusing variation of dangle.

Maybe now the Apple people can work on a copywrited dongle icon (-:

> These codes only have a resolution of 100 ms, so even if you knew UTC precisely you could point your telescope to a given point on the celestial sphere to a peak-to-peak error of 1.5 arc-seconds along the right ascension axis.

If you want to synchronize your clocks to within 100ms or even 50ms, you can dispense with a WWV(B) radio clock, and just get an internet connection. You can easily synchronize your clocks to these accuracies using NTP (the Network Time Protocol) across the Internet. Have the network connection has other, obvious benefits as well...

See RFC-1129 for all of the gory details.

What is currently being done 100 GHz and up? Is there commercial communications gear in that range, and if so, does any show up on the surplus market? Does anyone on the net have experience in that area?

I posted this once before, but had some mail trouble and missed info-hams for a while. Please email, and I will summarize to the net.

Well now, if packet radio does actually just "repeat" messages whithout checking authorization (if it is not destined for me send it on) would it not be possible for some non-licensed pirate to upload files and have them sent with no authorization??

Also.. I'm preparing to purchase a TNC myself, the computer I will be using is an Apple][c. Are there any programs to interpret WEFAX and such on the Apple? I know some exist for the Macintosh, and MANY more for IBM's, but I'm looking for Apple][series.

Also (again), What baud rate (Whats the diff between baud and bps [bits per second]?) should I get? I see ads that say "2400 baud with up to 1200bps". I'm confused. I use a 2400baud modem on my Apple already, so dont want to run packet slower than that unless it will cost an arm and a leg.

And last, but not least, Could my current modem be used for packet at all? I know packet is a "burst" transmission with temporary carriers, and modems are constant carriers.... but is it possible?? (trying to save $$)

This is definitely a future item, though, as the price of current GPS receivers is absolutely frightening.

1. GPS satellites have been up since 1978. The Block I's were and are o.k. for time transfer; actually they are better than the Block II's since Selective Availability is not currently implemented on the Block I's.

2. You can get a basic GPS receiver now for $3,000 (U.S.) and several companies have announced receivers for delivery this year with even lower prices. Perhaps not at hobby prices yet (but well within the gra$p of a well-healed yachtsman) but the time will come (within 5 years, probably) when you'll be able to get one for about $500.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

```

Has anyone gotten a G3RUH 9600 baud modem working on any radio on 220 MHz? If so, could you please specify what radio, and any other personal experience that you may have had with these modems. I am especially interested in any reports of problems using them with PLL radios.

I am aware that they are a "plug and play" with the new Kantronics DVR units, but Kantronics doesn't make one for 220. In addition, the TAPR packet-RADIO seems to be pretty well bogged down, and their beta test models are now going to be strictly on 2 meters vice both 144, and 220 MHz.

Any "hints or kinks" would be MOST appreciated!

Thanks for your time.

And what how are these bits encoded? I means thinks like which seconds
of the minute cooresspond to which data item, etc? And what is this
"other junk"? Anything useful?

As I understand it, you can't just apply for a reciprocal license while
there. The only people I have heard of who were able to operate there
buddied up with a member of the royal family and operated his station.

I would check with the ARRL at 203-666-1541.

True, but I don't do much mobile work. I can re-program all of the
R7000's 99 memories from the computer, so when I want to run
computer-less, at least I can set it up easier. I think that
"relational" databases and the like on a mobile unit is a bit
much, I don't want all that stuff while I'm trying to drive :-)

However, the nice scan-delay features would be useful anywhere.

If you're talking portable, it's no problem to run from a laptop. He** many laptops are no bigger than an R7000!

>Can you have it stay on the frequency as long as there is a signal for
>up to 30 seconds, and have it stay after the signal is lost for up to
>2 seconds? Does the computer get to control things at this level? Does
>it get to know when a signal is present and gone instantly?

Yes on all counts. Set either timer to anything with about 10th second resolution. The R7000 makes signal-detection easy, the recorder-control relay is lightning fast, you do lose that function for recorder-control though. This is no problem for me, I use a VOX recorder for that.

Again, the computer has some drawbacks, but I still claim it will be a long time before manufacturers obviate the need. My program uses tons of memory, just the channels data takes 64K. Because when you start having hundreds of channels, you really need a text description to keep track of it all. Also, you'd like to be able to deal with your frequency lists with a text editor, import them from BBS files, print them, etc. That's going to take quite a bit of hardware and software to build into a scanner.

I've noticed lately a couple of products that will let you "download" your PRO 2004 from a computer, i.e. set the channels up. It's slow so this type of control isn't good enough for scanning, but its a start.

I doubt it. It's still largely undeveloped, and (totally) under-utilized.

Since 24, 47, and 76 GHz have all been done already, the next band to tackle (in the USA) would be 120 GHz. (At least I think that's where it is; I don't have any reference materials handy.) I was working on 76 GHz before I quit my job and came back to school, but I don't have any time for it anymore.

Re format of WWVB transmission: you can find it in a lot of detail in "Reference data for radio engineers" which a good library would have. I would assume that a letter to WWVB asking for information would also work.

As for phase locking to the carrier, be aware of the WWVB ident! The way it identifies (if memory serves) is that the carrier phase shifts by 45 degrees at n:05 and back at n:10 every hour. If you weren't expecting that, you might see some strange effects...

Yes, the AEA Isoloop is a real product. I saw one up close at Dayton, and several hams in the Seattle area have been beta-testing them and reporting great results. Personally, I prefer a larger antenna, but it sure seems small and versatile, and the remote tuning makes it flexible and fairly efficient. My friend KA7MCX bought one, and has been working a lot of DX on 12 and 17 meters with it. I wish I could get him to replace the radials on his Butternut vertical and do some A/B testing just out of curiosity.

On the plane back from Dayton I ran into Mike Lamb, N7ML, AEA president. He showed me a log sheet of all the DX he has been working on his. Quite impressive. Of course you could work the same stuff with a dipole, but I think they have a hot product here. It does seem a little expensive to me though.

Yes, you can keep taking tests until you have passed them all. It has even been done in one sitting. My friend JA5GLY came to visit me in 1981, when they were still testing hams at the FCC. He went to the FCC office in Seattle and in one sitting passed all of the exams, Novice through Extra.

If you pass the Novice test, it makes sense to sit for the Tech exam too, even if you have not studied for it. You never know...you might get lucky!

THIS MESSAGE IS FOR THE GENTLEMAN WHO ANSWERED MY QUESTION RE: PROGRAMMING
AN MX-330S. SORRY... DON'T HAVE YOU NAME OR ADDRESS SO HOPE THIS MESSAGE GETS
TO YOU. MY MAIL WASN'T FORWARDABLE DIRECT.

SORRY FOR THE DELAY IS ANSWERING YOUR MESSAGE...
THANKS FOR YOUR RESPONSE CONCERNING THE PROGRAMMING INFORMATION ON THE
MX-330 PROM. I HAVE A NEW PROM WITH 48 EMPTY SLOTS (12 X 4). ALL THE
FREQUENCIES I'D LIKE TO HAVE BURNED IN ARE ON THE 2 METER HAM BAND SO THERE IS
NO COMMERCIAL INTENT HERE. MY CALSIGN IS WB2JBS. I'M NOW PORTABLE 4X AS I'M
WITH A FAB OF INTEL ELECTRONICS HERE. I ACQUIRED THE MX-330S WHEN I WAS AT THE
DAYTON HAMVENTION - I WAS LOOKING FOR ONE FOR QUITE SOME TIME... NOW ALL I HAVE
TO DO IS GET IT ON FREQUENCY !. PLEASE SEND ME THE PERTINENT INFORMATION
IF YOU CAN HELP AND I WILL FOLLOW UP IMMEDIATELY.
E-MAIL SEEMS TO WORK WELL BETWEEN US...

THANKS AND 73
RICHARD HAREL

I don't know if it is I that you were referring to, but I was designing such a widget. It turned out to be MUCH easier to build an on-the-PC-bus card for driving a rotor, with a TSR to drive it. What you need is an Analog-to-Digital Converter to read the rotor position, and a couple of bits of parallel port to drive the rotators.

I built mine from a JDR Microdevices PC breadboard card (the one with all the bus interface and address decoding on the board already), an ADC0809 chip, an 8255 chip, and some transistors. Total cost, around $30 or so. Took an evening to build it.

Software to drive it took another two evenings; it's a short program in assembler that just samples the ADC and compares it with a desired value that's fed to it from the InstantTrak tracking program. It's compatable with the Kansas City Tracker calls that IT uses; if you're using some other program it might not be.

I'm planning to add two serial ports to the card (probably an SIO or a dual 8250 or something like that) so that it can talk to the controllers inside my radios and do tuning and such. Haven't done that yet; part of the reason is that several of the tracking program principals aren't yet in agreement over how to pass the value for 'range rate' (change in distance between you and the bird, which determines the doppler shift).

- Brian

all of which underscores the existence of a cult-like security mentality in certain government agencies. Their codes are presumably secure; their transmissions can be monitored by anybody; their site can be found by anybody by DF-ing; they are not located in a war zone where they're likely to be overrun by a raiding party at

any moment. They have nothing to fear from ordinary citizens
knowing the location and purpose of the site. It's safe to assume
that any "enemy secret agents" already know these things, if they
want to. Pardon me for sounding political and cynical...

Does anyone out there in ham radio land know what the schedule is for
Armed Forces Day? Do you have a list of the stations, times and
frequencies and modes they will be operating? Thanks alot.

OK, OK, enough! I'm tired of seeing requests for info on the DAK receiver, so I decided to pare down my file on it and post what I have along with my own observations (mine arrive on Monday 5/14). First, my observations:

It's noisy and not very sensitive. I guess it works better than my old Heathkit GR-64 five tube set, but definitely not up to the better sets. With a 50 foot long wire, it is not the equal to my Hammarlund HQ-180 with a 3 foot wire dropped on the floor. The Hammarlund was pulled from a dumpster and with the exception of cleaning, straightening the tuning cap plates and replacing the VFO tube, it hasn't been touched. I have no idea how out of alignment it really is.

AM and FM performance is VERY bad. My daughter's $39 Emerson boom box pulls in stations (and sounds better) than the DAK set. Sound quality is harsh and garbled on some stations.

I monitored a pile-up on 40 meters last night with my Hammarlund. It was able to separate stations quite well with the 2kHz selectivity. The DAK was hopeless.. my guess is at least 10 kHz selectivity. I also tuned it WWV at 15 mHz with a good signal and found an image at 14.100 mHz that was almost as strong as the original. Reminds me of the GR-64 ;`) I also get an RTTY signal on the AM band at 1260 kHz, so image rejection there must be poor also.

I also monitored several stations that had severe fading. The ANL on the DAK radio has about a few second time constant, so that it didn't help much. The Hammarlund worked fine!

My recommendation: If you're a casual listener and don't care to listen to anything but strong stations (WWV, VOA, BBC, etc), this is a bargain, otherwise, look elsewhere.

Jon

I've had one for two weeks now. I ordered it because of the digital frequency readout, and that 'PLL' stuff that supposedly is the best for SW (although I don't excatly know what it is).

However, the shortwave is disappointing. I don't know if it is the receiver or the antenna, or something else. I have a 14 year old Telefunken radio casette, and although I have to play patiently with the analog dial (and never know what frequency is exactly tuned), I usually get the Deutsche Welle as clear as a bell, whereas on the DAK I often don't get it at all, or it's with a noisy background.

I'll keep the DAK, though, for other reasons. It's a neat little AM/FM receiver with digital frequency readout and station buttons, and it's also a radio alarm clock (when it's turned off, you see the clock in the digital display). It has adapters for AC, external antenna (for better shortwave reception, I suppose), and headphones). With good headphones, it has a reasonably good sound, and the amplifier has plenty of reserves you'll never use.

Regards

Subject: Re: Request for Info on DAK radio

Kavan:

No, it has just one timer. Actually, the SW is not quite as bad as I may have described it. Especially if you go outside and play around with the antenna, you get quite a few stations, at least in the 49 m band (my favorite band), with reasonably low-noise reception. So the problem may actually be in the antenna; at this point, I don't know.

On the other hand, my old Telefunken keeps astonishing me. When I bought it in 1976, I didn't even worry about shortwave, I just needed a portable radio recorder. Then I find that it has not only quite good short-wave reception. You'd have to get an expensive stereo to match the sound quality (over good earphones). I really wish I'd find a similar compact unit with all these qualities, PLUS digital frequency readout. ... Well, just got carried away a bit.

Regards,
Peter

Due to popular demand, here are some details about the $50 DAK MR-101. First, I was positively surprised to find that the small unit (7 x 4 1/2 x 1 1/2 ", one pound) not only had an external antenna jack, but also a headphone jack and a connector for a 6V DC power converter, such that you don't have to 'subside' on batteries alone. Normally, the thing is powered by six AA cells.

The amplification is more than adequate, and the sound is reasonably adequate with headphones. When it is off, the time shows in the LCD display, with a 'ticking' mark for the seconds. So far (for about 2 weeks), the clock has been accurate.

Shortwave tuning is in 5 Khz increments. There is nothing to show signal strength. Since I don't have much experience with SW radios and nothing suitable to compare it to, I submit a test of the 49 m band (5,800 to 6,200 Khz). The test was done at 9:30 p.m. EDT in Columbus, OH. I am listing the stations with what I consider 'usable' reception. That includes stations with various levels of background noise, but not that much that you can't make out the actual broadcast anymore. I just categorize them into 'relatively noise-free' (default) and 'noisy' (I did not attempt to identify the stations - just happen to know that at 6040 Khz was Deutsche Welle).

Khz	reception
5850	noisy
5945	noisy
5950	
5960	
5975	
5980	noisy
5985	
5995	
6040	
6050	noisy
6130	
6145	noisy
6165	
6175	noisy
6180	noisy

6119

Some stations came in as clear as a bell. On other days, and later at night, I received Deutsche Welle at 6075, and Swiss Radio Int'l at 6135 (the latter a bit noisy).

I hope this amateurish benchmark test gives the pros among you some idea about the DAK. Given the above, I would also like to know what YOU think.

I received my DAK radio, finally, this afternoon. Here are my first imressions:

The sensitivity seems pretty decent. Something similar to Sony 2001. I was able to receive BBC (15260), RA (21470) and some other station. A notable one was All Idia Radio External Service at 1300 UTC on 15110. The weather and prpagation were good today. I have thirty days to see whether it is worth keeping.

On the negative side:

It has two bands The upper band starts at 9500 and goes to 26000. So some of the 31 meter stations (like 9400) cannot be picked up.

It does not have direct tuning. So it is not very quick to go from one station to the other unless it is one of the six preset frequencies.

The frequency steps are in 5 kHz and not 1 kHz.

All in all it seems to be good radio to take along to office or on atrip so as not to miss your favourite BBC sports roundup or some some such program.

It is made in China and I do not know if it is a licensed clone of the Phillips radio.

I'll give a detailed account of my impressions in a day or two if nobody does it so by then.

I heard a review of the DAK receiver on Radio Canada International this evening. I don't remember all the details, but there were pluses and minuses. It's apparently a very good deal for the $49.90, but there are some caveats: 1. it's made in the PRC (they're having cash flow problems since that little `incident' with the tanks, not surprisingly), 2. there's no tuning knob (instead they have a few station select buttons and a couple of buttons to scan with), 3. it's not very sensitive (apparently only people in coastal areas will do well with reception), and 4. the 5 kHz jumps between frequencies limit its useability outside of North America. Caveat number 1 was enough to kill it for me.

Disclaimer: I am only reporting what I remember of the review. I have never seen the DAK receiver myself, and have nothing to do with DAK or the PRC.

Hello world!

While playing around with the DAK I discovered some strange anomolies:

1. It performs quite well WITHOUT its antenna extended.
2. When I use the antenna, its reception improves marginally (if at all).
3. When I use an external antenna and plug it into the external antenna socket, its reception DEGRADEs dramatically.
4. When I attach an external antenna to the regular antenna, reception improves.
5. If I partially insert the external antenna into the headphone socket, reception improves.

To give you an idea of how it performs: I compared the DAK with a SONY SW1S and a 2001 and found that the reception on the DAK is much worse than the SONYs. As noted above, my DAK without its antenna extended receives better than the SW1 without its antenna but then who cares about that?

Further when I tuned into BBC at 5975 Khz, the DAK added a loud whine to the BBC transmission. I'm certain this whine is introduced by the SW rather than some external source because neither SONY picked it up.

All in all I'm pretty disappointed by the DAK. I'd like to know what other people feel about their DAKs - maybe I got a lemon. I suspect that my antenna is grounded. Any suggestions, comments?

Going back to TV

Well, my $50 DAK radio has conked already. The Power switch stopped working, so I used the "Sleep" button to turn it on, and even that went today. I can not turn on the radio now at all. It'll go back to DAK today.

What I'm wondering is -- how is the $200 unit by Sangean that DAK advertises in its latest catalog ? The one with direct entry tuning and so on? How would that compare with the SONYs/PANASONICs in that price range?

Thanks in advance,

Vibhu Mittal

In article <2774@hudson.acc.virginia.edu> (Jon Brinkmann) writes:
>...The DAK is not
>the Philips AE-3805 (although my bet is that it's a clone!)...

Right you are. I had hoped to post a review of the receiver by now, since mine finally came last week. Unfortunately, I had a case of infant mortality: somethings blown in the radio's amp, and even turning it up full blast I barely get any sound.

Since it could have been a simple short or loose wire or something, I couldn't resist opening it (if anybody tells DAK, I'll scream since I'm returning it). The answer is:

ACE ELECTRONICS, China. Printed on the circuit board.

Mini review:

The radio *feels* cheap. The volume slide pot is extremely wimpy, and slides all too easily. The keys and case are all hard plastique, no texturing, which combined with the light weight, also adds to this perception. The "dial" light is almost no help, illuminating the edges of the display too much and not enough on the center. It also created an audible pop when I hit the "Light" button, but that may have been an artifact of the other problems my specimen had. The speaker is real wimpy, I wouldn't expect much fidelity of any sort (.5 watt amp 8 ohms, 2 inch speaker); there's no tone control.

Basically the radio has all the advertised features, and they all work. The central computer module, which I bet is OEM'd from Phillips, has all the features of the Phillips radio including standby, clock, timer, alarm, etc. I don't understand why the "Lock/Unlock" key is there. It's in the same place as the on/off, the same kind of switch, and doesn't stop the radio from turning on anyway, just from changing freqs. When the radio is off the display shows the time, and when it's on, you can toggle from time to alarm to freq display. The major controls were all unbelievably wimpy in design (on/off, lock, volume) except the "computer" keys (tuning, alarm, memory) which are a rubber membrane with studs shorting points on the upper computer circuit card).

From the little I could hear, the radio could get the major stations, but was much susceptible to noise (no shielding and a dozen patch wires on the circuit board) and fading. So I'm used to my Sony 2010, and it's wonderful Synchronous circuit, sue me. I heard to BBC (5975 & 9640, Moscow(15425) WWV (5&10) and Australia on 9580. Fine. I could get these with a tin can with an antenna, but it lent credence to the fact that this really was a SW radio. I couldn't hear CFRB (6070), Tahiti (15171) or anything of moderate DX difficulty, but given the radio was barely putting out any sound, I can't tell whether it's the radio design defficiency or the audio amp problems.

Tuning via the slew keys takes some getting used to. Holding the slew key puts the radio into a scan mode, stopping at loud stations. If you want to stop at a particular frequency, you have to time it right and hit the opposite slew key to stop the radio from scanning. The memories worked, but there is no backup battery - you lose the settings whenever you change batteries :-(.

Now for the real test. I get to return it and see how long it takes to get a replacement or repair from DAK. So whaddya want for $50?

marc

I suspect the DAK radio performs just about as well as the thirty nine cent cigarette lighter I just purchased at a local drugstore. Made in China and --you guessed it-- no flame no matter how many times you flik! Maybe if I attached a long-wire . . .

At least you stand a chance of getting your money refunded.

As for the lighter . . .

You get what you pay for...

DAK shortwave radio for $49 is not very sensitive, but does lock onto the stations reasonably well. The FM sound is very good, but alas, it really is just a fifty dollar shortwave radio. Its battery consumption is surprisingly high, and the unit is not stable on the table (it tips easily). It serves well as a second portable, but one of the first things I had to do for it was purchase an AC adapter from Radio Shack (approx. $8).

For serious portable shortwave listening, I recommend Sony Pro-80 ($350-$400).

>> Refs to Crossed Field Antenna

There is an article "The Cross-field Antenna in Practise" by C.Bryan Wells in the English magazine "Electronics World + Wireless World" November 1989 pp1109 - 1111 in which the author describes his experiment and comes to the conclusion that it really does work.

He's using an antenna made of tinfoil covered milk powder tins (REAL ham-radio :-) which gives a size of 700mm (about 2 feet 6").

I quote (he's talking about using the antenna on 40m):

... " At night the results are almost as good as both my double zepp
and an 82m (meter) circumference vertical loop, both at about 10m (32ft).
The full-sized (700mm) CFA is mounted against the peak of the roof space
in the house at about 8m (20ft) above ground"

```
---                       the bits in parentheses are my additions
```

He then goes on to describe various checks to ensure that the CFA really
is doing the radiating and not just acting as a bit of metal at the end
of a feedline and comes to the conclusion that it really is radiating.

The person in the next office informs me that there's another article in
the latest issue but I haven't seen it yet.

Cheers
Giovanni ZL2BOI

```

The Secret Service currently uses Motorola radios with DES based DVP security mostly on a group of frequencies in the 160-170 mhz federal segment. As far as I can tell, the frequencies are mostly the same old phonetic alphabet channels (BAKER, CHARLIE, DELTA, GOLF, NOVEMBER, OSCAR, TANGO, SIERRA) that they have used for the last 40 years for presidential protection. I do not have a list of the frequencies here at work, but if someone is interested I can look them up. There has been some realignment of the 160 mhz federal frequency spectrum by the IRAC as more and more federal stuff shifts to secure modes such as DVP and more flexible operation such as trunking. This may have resulted in some reassignment of traditional 160 mhz secret service channels, but they seem to have been using the old standard ones pretty regularly too.

Communications on the presidential protection channels are mostly all encrypted now with DVP, but occasionally someone will transmit a message or two in the clear. The secret service also has available some assignments in the 409 and 414 mhz areas - as far as I know these are not heavily used for presidential security. Much of this 406-420 mhz band has been restructured and the old secret service frequencies here may and may not still belong to the secret service any more.

DVP is FSK modulation (frequency shift about 8 Khz or so) of DES encrypted CSVD digitized voice. My recollection is that the bit rate is 16 kbs. The system is pretty secure, since it uses DES in a cipher feedback mode, and the keys are changed every month or so (or so I have been told). The radios all have dual secure/clear mode capability and appropriate squelch circuits so communications can be sent either in the clear on NBFM voice or secure on a transmission by transmission basis. I think they either have a secure push to talk and a clear push to talk or a mode switch since one occasionally hears one half of a conversation in the clear and the other half secure. To untrained ears the DVP signal sounds like white noise, but it will unsquelch many scanners.

In addition to the presidential protection channels now rendered largly useless to scanner freaks there are channels that the secret service sets up for coordination with local law enforcement. These vary on a city by city basis, but often have quite a bit of activity on them. They are often secondary frequencies licensed to local or regional police agencies and used during special events.

And of course for the hard core, there are the various radio-telephone systems used by the president and vice president as well. I have posted descriptions of these to the net at various time in the past.

I've wanted to have a Ranger for some time, mainly because I always liked the way it was set up, and the broad coverage.

to have been plugged in since 1975, judging from the decayed rubber of the power cord and a service tag. Over all, it's on great shape, I doubt I'd look that good after being sealed in a box for 15 years.

Major problem: The band selector was frozen, now it's really high drag, I can fix that, but the knob, and the cam (inside that shifts a pot[core/switch?] as the shaft turns.) have both become loose. Anyone know what position these should be in at 160 meters and 10 meters?

Also, I could use the pinouts for the crystal socket(and other crystal info for it's use), the jumper socket on the back, the phono jack in the back (Best guess s
is for the key.) And the shielded plug, which I belive is the mike jack.

At full drive, what is the rated power out? And a good antenna for such a widebander? A 160m wire is pretty much
out of the question.

Thanks in advance.

I agree a 'priority' sampling rate of several seconds is quite silly.
What is *really* needed to implement this properly is a second, independent
receive channel for the 'priority' frequency. Yhis receiver sits on its
allotted frequency all the time, listening. Then by some simple logic,
you just switch the audio from one receive strip to the other when the
'priority' squelch opens.
This is quite common on marine receivers where they have a 'watch'
receiver on 2182KHz (or the other distress frequency - 500KHz isnt it?)
which is on all the time.
If it can be done with dual-band ham rigs, how long before some smart
manufacturer does it in a scanner?

Funny. I don't want to spoil your business, but I just want to share something with you guys over ther in NetLand. Keep your eyes open and you can make some *real* deals.

A couple of weeks ago I found out that a local hospital was dumping their VT-52-compatible terminals (new ones coming in, of course) and had no idea what to do with 'em. Unfortunately, they decided to literally dump them - and when we got there, only few were left.

Well, one dollar (approx.) per terminal wasn't all that bad. And those TT-43's we got three for $2.. kinda quantity discount.

Terrific fot packet, work like a charm. I sure will keep my ears and eyes open and act quicker next time.

Luru

While I was in Dayton, I keyed up a repeater on 2 meters (exact freq.- I don't remember) that was linked with something like 20 other repeaters in the Mid-West. It was quite impressive and didn't seem to be abused. Can someone fill me in on some more info ? I think the Southern CA. - South-Western US area may have a similar set-up...
Internet is fine.

Hi. I am a member of Group 70 which is building a large amateur astronomical observatory. We eventually intend to have it completely automated (remote controlled ?) and need a very accurate clock for the observatory.

I believe that NIST?(NBS)transmits a very accurate clock on 60khz, Could someone give me information about how I could use this to calibrate a local clock? We need absolute time that is accurate to better that +- 300 microseconsd of course, greater accuracy ie even better for astrometric purposes.

I have looked at a 8 year old copy of the 559 manual but it makes no mention of the 60Khz signals.

Thanks

How much power can a piece of coax handle? Well, it depends on what is at the end! With a perfectly matched load, your coax will actually handle a lot more power than with a mismatched load. Mismatch generates standing waves (hence current and voltage nodes) due to the energy reflected from the load.
A perfectly matched load absorbs all the energy fed into it, so no reflection and no standing waves. This state of nirvana is rarely, if ever, achieved in the real world, despite what antenna makers wish to tell us.
I have pushed 400 watts down a length of RG58 when it has been properly matched (that is, feeding a dummy load) yet similarly i have seen flashover at 200 watts on the same feedline with chronic feeder mismatch (open circuit at antenna feedpoint;. Oooer!). Of course, feeder losses will also increase with increased mismatch - the ultimate feeder loss being when it flashes over or cooks the dielectric... exit one length of feeder :-)

<--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society
<<phil@ux1.cso.uiuc.edu> | no matter what the particular issue is all about.

Actually Phil, they're on VHF around 167 Mhz. (You can also know the exact frequency by asking around or by checking out some of the "Secret Government Freq. Listings" directories. Don't get your hope up too high - they're on DVP mode - all you'll hear is white noise when they transmit and a short tone burst at the end of every transmission (this let's the agent know that the DVP feature on the radio is still working - the DVP "Key" is easily erased by disconnecting the battery when the radio is on). This "key" is a 64 bit algorythm developed by Motorola. It's based on the NIST 72 bit Data Encryption Standard (DES). The NSA rolled it's own form of voice encryption code named "Fascinator" used by the President and "above". Some agencies are now using another high level encryption method called RSA. Unless you have a super-computer and know how to tackle the problem, this stuff will remain encrypted the way it was meant to be... there's always the Japanese who might put "DVP decoding" features in their hand-held scanners one day.

[-=-]

Well I finally decided to do the 'euro' mod to my PRO-34 (restore the 66 - 88 MHz range). Based on the collection of PRO-34 mods I collected from the net I added a diode to D-9 (the old one removed from D-11 when I restored full 800 Mhz). It appears as though I now have this new range of frequencies -BUT- at the cost of my 30-54 MHz range :-(

Its an easy job to remove the diode and be back where I started but my question is: Has anyone been able to get both? Does anyone actually use or check these mods (in particular this one)?

One other note on the PRO-34, a few nights back while busy with other things I wanted to place the scanner in manual and select channel 21. Not watching what I was doing, I somehow got the scanner on channel 210! At this point I could step with the manual key and the #'s kept going up. When I pressed scan it continued going up unitl the PRIORITY kicked in. Since then I have not been able to reproduce this, has anyone had any luck with extra channels? (Oh yea - these new channels were all set to "0.0" while my original 200 remained programmed)

I don't know if amateur radio is subject to different regulations than
other services, but I should point out that HBO is transmitted, via RF
frequencies, by satellite, to home viewers (TVRO). I don't quite catch
the distinction that would allow this and preclude Internet-originated

transmissions.

The difference is the Amateur Radio regulations.
For one thing, business communications are not permitted.
For another thing, the originating station is supposed to have control over
any transmissions from his station. This means he must read each message
before it is transmitted.

I believe internet messages COULD be sent over Amateur packet radio if
the originating station licensee were willing to read 1000% of the messages
before they are transmitted.

I also agree with Scott. My pro-34 interupts normal scanning every 2 seconds to monitor the priority channel. This is a very annoying interuption to have to contend with if nothing is happening on the priority channel.
I would rather have a scanner that doesn't interupt normal scanning unless a carrier is present on the priority channel. As it is now, the pro-34 interupts regardless. It wouldn't be so difficult to have circuitry monitor the priority channel to see if a carrier is present and if it is then and only then go to it. I believe some of the later bearcat scanners are doing this.

Yes, every ten years. A few years back the license term increased from five to ten years. This is true for all license classes. The same Form 610 that is used for change of address and modification to the license is used. There is no re-examination required.

Briefly...

We took one of the DAK MR-101 rcvrs outside and compared it's performance to a Sony ICF-2003. Immediately obvious was the DAK's low audio level (this was using the built-in whip antenna on both units). We plugged the Sony long-wire antenna (hardly a long-wire electrically, but you know what I mean), into both radios and noticed that the Sony output changed little, but the DAK's increased dramatically. The AGC on the DAK seemed marginal, either a poor control range/slope or a ridiculously high threshold. The audio quality was not much worse than the Sony.

With the external antennas, both radios seemed to have similar sensitivities. All this testing was done at 3:00PM PST, receiving stations from 5MHz to 21MHz. The comments made in other postings seem to match our experience,

```
especially in regards to the lack of "quality feel" to the radio.

Can you have it stay on the frequency as long as there is a signal for
up to 30 seconds, and have it stay after the signal is lost for up to
2 seconds? Does the computer get to control things at this level? Does
it get to know when a signal is present and gone instantly?

I gather there are some unusual political problems with third party agreements. Last time I looked we had them with countries like Cuba and Nicaragua, but not with Great Britain or Germany. It seems to me that the biggest reason a country does not is the paranoia that it may lead to long distance telephone revenue losses.

I may be spending a long while in Saudi-Arabia real soon and would appreciate any information and experiences from anyone regarding the (slim) possibility of being able to operate while there. Also, I will be within driving distance of Bahrain, would it be possible to work from there when visiting on weekends??

Tnx, de km4jn

Several months ago I purchased the latest A.R.R.L. Antenna Book (blue cover, 1988 copywrite) and found a fasinating article on small loop antennas tuned remotely by a motorized capacitor at the high impedance point in the loop. This article is "Small High Efficiency Loop Antennas for Transmitting" on page 5-11 of the Antenna Book.

What was so special was the data listed for several sizes and the very high efficiencies claimed. Well, I hummed and hawed and was still "thinking" about possibly building one (if I could figure out a neat cheap way to build my own variable capacitor that could withstand the very high voltages developed across it)...when AEA advertised a small loop with remote tuning, etc.

So far I have not seen any prices...is this a real product...available for shippment?...or is AEA just testing the waters to see if there is any interest before starting production?

Anyway, has anyone actually built the antenna described in the Antenna Book? I
I'm considering it for use in an attic with foil backed fiberglass insulation used as the groundplane as described in the article.

Please post to this newsgroup. Thanks. Bill, N0LAJ, Denver

I have a neighbor with an Apple2. It emmits a strong signal on 146.76Mhz.
I have heard of this being a problem with all Apple2's, and know two other people who have a problem because of it.

If anyone has information on how to move the frequency of this signal, PLEASE send me email.

Thank you very much,

Todd M. Bezenek

John,
I cannot help with you your clock question but I wish to mention
that SKY AND TELESCOPE some 3-4 years ago (don't quote me) did an
article on a person in the southwest who built a completely
automated observatory on his property (in UTAH?). I don't
recall anything beyond that but suggest you ask S&T the details.
They may point you to who that individual is.
good luck,
joec@morgan.com

I just picked up a Kenwood TR3600A with DCS.  I'd like to program a
paging function into my repeater using this technique.  Unfortunately,
the manual sez little about how this works.
  [stuff deleted]
I'm also interested in why the scheme never caught on.  I don't think
I've ever heard the digital bursts on the air.
----------

  Sorry, I can't help you with the technical info on DCS.

  I believe that it never caught because it was a single-vendor
  solution and one which did not allow easy upgrade/capatability
  with existing equipment.

  Kenwood has recently put a DTMF squelch system in the TH-26
  handitalkie. (ICOM has put this in a few rigs also.) This
  makes alot more sense to me. Anyone with a DTMF encoder can
  call you if they know the magic sequence.

Hi,

I have a question I am hoping the HamNet can answer.

If you take the NOVICE test and pass can you immediatley take
the TECHNICIAN test, which I believe is just another written test ?

If you pass that can you immediately take the GEN test ?

thanks in advance,
Mel

Following the frequency expansion modification (as specified by Icom), a sample IC-24 was recently tested for tuning range and input sensitivity for an S9 signal. While the sensitivity measurements should not be directly compared with the manufacturer's specifications (usually measured reference to a signal-to-noise quieting ratio), this "quick and dirty" data should give you a good idea of the sensitivity to a medium-strength signal.

Tuning Range	Mode	Band	Sensitivity for S9 Signal
74 - 107.995 MHz	(fm)	VHF range	approx 1 mV
108 - 136 MHz	(am)	VHF range	10 - 30 uV
138 - 240 MHz	(fm)	VHF range	1 uV - 1 mV (1)
250 - 302 MHz	(am)	VHF range	50 uV - 1 mV (2)
310 - 354.995 MHz	(fm)	VHF range	50 uV - 3 uV (2)
355 - 409 MHz	(fm)	UHF range	3 - 10 uV
417 - 490 MHz	(fm)	UHF range	1 uV - 100 uV (3)
805 - 955 MHz	(fm)	UHF range	10 - 100 uV

Notes:

(1) The sensitivity from 138 - 150 MHz was 1 uV. From 150 - 240, the sensitivity decreased almost linearly from 1 uV to 1 mV (with input voltage plotted logarithmically).

(2) The sensitivity increased almost linearly for both these ranges (with input voltage plotted logarithmically).

(3) The sensitivity plot looked like a "U" with the bottom of the "U" corresponding to the range 440 - 450 MHz (1 uV). The sensitivity then got worse below 440 and above 450.

Another vote for a IC02 AT/E as a good buy for a second hand HT

I have been using the European version IC02E for 5 years now. It has had a hard life, and has been a trusty companion. I use it for hill-walking and backpacking, its small enough and light enough to be a 'must' in the rucksack.
I have operated in rain, snow and temperatures from -10 to +30 degrees C.
The NiCd's had a bit of difficulty at -10. It is ruggedly constructed with

a metal back and anti moisture grommets on all the knobs.

Disadvantages: Only got 10 memories, repeater shift a pain to program, scanning is funeral procession speed.
Advantages: External DC/mic/speaker if you want. Standard ICOM batteries reasonable power (3W), good reports of audio from internal mic. Can extend receiver coverage to 138-163MHz.

73 de James

At the request of several interested hams, I am posting the modification instructions for the Icom IC-24AT. This set of instructions originated from Icom America and was downloaded from the Icom Library of HamNet (Compuserve).

Ken WA6TTY (kenw@col.hp.com)

IC-24AT Undocumented Features - (from ICOM)

The IC-24AT dual band handheld had three additional features that are not described in the owners manual. These have been left out of the owners manual because some countries restrict the use of the radio in these modes.

AM AIRCRAFT RECEIVE PLUS 740 to 960 MHz RECEIVE

Remove D13 from the main logic board (this diode may already be removed by ICOM in some units). This diode may already be removed in some radios. D13 is on the main logic board and is a discreet diode (one of the two in the radio) near the center of the board. It is the left discreet diode of the two on the board when the radio is open and held with the controls away from you.

Simultaneously hold "Light", "B", and "#" keys depressed and turn power on.

It is important to note that the radio will not meet specification on the out of band receive frequencies that are enabled with this modification.

DIRECT KEYBOARD ENTRY of 100 MHz FREQUENCY

Simultaneously hold "Light" and "3" keys depressed and turn power on.

CROSS BAND REPEAT (simplex)

Remove D14 from the main logic board (this diode may already be removed by ICOM in some units). The diode is a discreet diode to the right of D13 (from above) and directly beside it.

Simultaneously hold "Funct" depressed and push "C".

To turn on cross band repeat:
Hold "Funct" depressed then push "5" and then push "D".

To turn off cross band repeat simultaneously hold "Funct" and "D" depressed.

Does anyone know if the 600-805 MHz is recoverable?

What are the specs on the Icom?

Lance

I am interested in building a DTMF decoder with either an Alph-Numeric Display, or single leds for each digit. The device will need to hold each digit for 1 second, although I would prefer a large display that would hold 10 digits.

Lance

I am not adverse to buying one for a REASONABLE price, either new or used.

While the subject of Internet->Packet gateways is floating around netland, perhaps this is a good opportunity to ask people's views about a Modem->Packet server. I have set one of these up whereby I can call in from a terminal on a phone line and access my station. I have also allowed other ham friends to do the same. I believe it is legitimate remote operation when *I* am operating with my callsign from a remote terminal. Is it within the regs to allow fellow hams to access this system and use their callsigns on my TNC to connect to packet BBS's... etc..??

The repeater set you are probably thinking of is the 145.19. It is linked as far west as Indy, and I think, maybe as far east as Akron? Maybe just Columbus. It does strech down into Kentucky. It is nice on the road. I believe the net is managed by the Fairfield (OH, Near Cincinatti) club.

Bob, N5GNA

Per a previous request, here is the Armed Forces Day Frequency info:

Military Stations:

AAE
Army MARS Radio Station
Fort Sam Houston, TX

NPL
Naval Communication Station
San Diego, CA

AAH
Army MARS Station
Fort Lewis, WA

NMH
Coast Guard Radio Station
Alexandria, VA

AIR
2045 Communications Group (USAF)
Andrews AFB, MD

NMN
Coast Guard Communications Station
Portsmouth, VA

NAM
Naval Communications Area
Master Station LANT
Norfolk, VA

NZJ
Marine Corps Air Station
El Toro, CA

NAV
HQ Navy-Marine Corps
MARS Radio Station
Cheltenham, MD

WAR
HQ, Army MARS Radio Station
Fort Derrick, MD

NPG
Naval Communications Station
NTTC Mare Island
Vallejo, CA

TRANSMITTING TEST: Military stations will transmit on the below listed frequencies and announce the specific amateur band frequency being monitored.

FREQ	MODE	STATION	FREQ	MODE	STATION
4005.5	USB	NAM	13975.5	CW	NPG
4015.0	CW	NMH	13986.5	RTTY	AIR
4018.5	LSB	WAR	13994.5	USB	AAE
4025.0	LSB	AIR	13997.5	CW	AIR
4030.5	LSB	AAE	14375.0	USB	NPG
4033.5	LSB	AAH	14385.0	USB	NPL
6970.0	CW	NPG	14389.5	USB	NAV
6988.0	RTTY/CW	AAH	14400.0	USB/ CW/RTTY	NAM
6995.5	CW	AIR	14403.5	USB	WAR
6998.5	CW	WAR	14408.0	USB	AIR
7301.5	LSB	NPG	14440.0	RTTY	NMH
7315.0	LSB	AIR	14480.0	USB	NZJ
7346.5	LSB	NMH	14488.5	USB	AAH
7358.5	LSB	AAE	14511.5	RTTY/CW	AAE
7365.0	CW	NPG	20937.5	USB	NMH
7372.5	RTTY	NAV	20975.0	USB	AAH
7375.0	RTTY	NZJ	20994.5	USB	WAR
7382.5	RTTY	NPL	20625.0	USB	NPG
7393.0	LSB/ RTTY/CW	NMN	24805.0	CW	NPG
10180.0	RTTY/CW	WAR	27820.0	USB	AAH
10259.5	CW	NPG	27950.0	USB	NPG
13927.5	RTTY	NPG	27992.5	USB	AAE

RECEIVING TEST:
The CW/Phone/RTTY broadcast will begin with a 10 minute tuning call and will precede each trans mission. The CW test will be transmitted at 25 words per minute beginning at 0300 UTC May 19. The phone/RTTY broadcast will begin at 0345 UTC May 20 and transmit at 20 wpm using 170 Hz shift. Both broadcasts will be transmitted from the stations below:

AAE: 4018.5, 6988.0, 9990.0
AAH: 4021.5, 7309.5, 13994.5
AIR: 6995.5, 13997.5
NAM: 4005.0, 7393.0, 14400.0
NAV: 7372.5, 14389.5
NPG: 7365.0, 13975.5, 24805.0
WAR: 4030.5, 6998.5, 14403.5

SUBMISSION OF TEST ENTRIES:
Transcripts of the CW/Phone/RTTY receiving tests should be submitted "as received". No attempt should be made to correct possible transmission errors. The time, frequency, and call sign of the military station copied as well as the name, callsign and address of the person submitting the entry must be included on the page containing the test message. Entries must be postmarked no later than May 27, and submitted to therepective military commands as follows:

STATION COPIED	ADDRESS
AIR	Armed Forces Day Test 2045 CG/DOJM

Andrews AFB, MD
20331-6345

AAE, AAH, WAR
Armed Forces Day test
Commander, USAISC
ATTN: ASOP-HF
Fort Huachuca, AZ
85613-5000

NAM, NAV, NPG
Armed Forces Day Test
Naval Communication Unit
Washington, DC
20397-5101

The above information was extracted from the May 11, 1990 issue of the AFCC Intercom, the newspaper of the Air Force Communications Command.

My apologies that I didn't get this uploaded sooner.
Good luck in the Armed Forces Day test.

PLEASE REMEMBER: DO NOT TRANSMIT OUTSIDE OF THE AMATEUR BANDS.
THE MILITARY STATIONS WILL BE ANNOUNCING WHAT FREQUENCIES THEY WILL BE LISTENING TO WITHIN THE AMATUER BANDS. THIS WILL NORMALLY BE IN THE LOWER PORTION OF THE GENERAL CLASS BANDS.

73,
Michael, WA7SKG

First, a little background:
I recently (hopefully) graduated*, and I was going to buy myself a TS-440 with antenna tuner, but since I don't have a real job yet (hint hint)

I am probably going to buy a 2m/70cm HT.

* I participated in the ceremony, but I don't have that BSEE until the postman visits with the diploma in hand [with my luck, it will be delivered to Madagascar or Pitcairn Island :)]

The point:I already know quite a lot about the "big 3"'s offering for dual band HT's, but I am curious about Alinco's DJ-500T (I think). Does anyone here have one? Know where I can find a review? Any opinions? [It's significantly cheaper and has a 2yr warrantee]. How about any other dual band HT's out there? I am staying here in rural Wisconsin, nearest repeater 25 miles away {if you don't count our schools that isn't yet up}. 2m is certainly not crowded, and 70cm (I believe) is practically non-existent. However, there is enough 70cm stuff on the trip home to warrant a dual band HT (IMHO). Besides, I'll be living somewhere else in August.

Please E-mail, unless you think your comments deserve a post. I'll post a summary if there is significant replies.

To the person who set up the mail-access callbook: A giga-blessing on you and your kin! Some of us don't have telnet, and you saved our club $$ (since we don't need a callbook now). Suggestions: Updated list, DX calls, and search by name (ya, I know, all hard to implement but one can dream)

Oh, as part of my graduation present, I got the CQ antenna manual, and I opened it up to see an arcticle by "our very own" Patty Winter (N6BIS).It's always neat to see an arcticle by a name you recognize.

Thanks for any input about the radio

I just caught the end of this discussion where the is a reference to a 40m antenna that is made of tinfoil covered dry milk cans ...? I would like to see any info on this but none of the earlier messages are still on our system. Could someone please summarize this for the net or send me any references that I could look up. Or if anyone has the other messages that made up this thread could they email them to me? Thanks in advance for any help.

Hey, is this the same company that made the wonderful AOR 2001 and AOR 2002 scanners??
I was very charmed by these two scanners, they only lacked a lot of memory channels, but it looks like AOR has learned. Very interesting! If this is the same company, I'd like to know more, maybe Michael (see below) is willing to post some first impressions...

In article <1990May16.202509.2429@ncsuvx.ncsu.edu> garvin@ccvr1.ncsu.edu (Michael A. Garvin) writes:

| FYI, I ordered one today from Grove. They have them for $459, and they
| are in stock and shipping.

Ah, an experienced user by now, I think ;-)
I'd love to hear your opinions on it. I'm pretty much interested in how it performs in the following frequency ranges:

```
68-88    VHF low, NFM
108-136 Air band, AM
```

200-400	Military Air Band, AM
440-512	UHF, NFM

Of course, there's a big difference in for what services frequencies are used in the USA and over here in the Netherlands, but maybe you can tell something about it anyway.

thanks for your time,
--[Edwin]--

Why make one? There is a DTMF decoder chip, SSI202, that does it all for you. All this in a 18 pin package. You supply the audio in and it produces a BCD output on 4 pins plus some other control lines.

There is a construction article in one of the old QST mags I have that
has most of what you want. I don't have the month/year of the issue but
can look for it if you are interested.

The circuit is a simple DTMF actuated controller. You can turn on LEDs, relays
and just about anything else you want. It uses flip-flops to store the incoming
DTMF digits. Once the proper sequence has been passed it will activate the
corresponding device.

NBS transmits 5, 10, and 15 (or is it 10, 15, 20 ?) Mhz signals which
are reputed to be THE time standard. Broadcasts are from Boulder, CO,
(WWVB), Hawaii (WWVH), and Idunno, (WWVL). They have an amplitude-
modulated tone (1Khz I think) and maybe some other stuff. Heathkit
(I'm not advertising for them) sells a "most accurate clock" kit which
will spit-out the time on a serial port for your computer's enjoyment.

I may stick my foot in my mouth here, but John Cincotta said he needed accuracy better than 300 microseconds. That means (assuming everything else is ideal) that you need to know the signal path length to within 90 kilometers. That may be a problem on frequencies where propagation may be by skip. Here is the part where I guess that a VLF signal is guaranteed to be arriving by ground wave so you just need to know the distance to the transmitter.

In article <1250157@hpnmdla.HP.COM> alanb@hpnmdla.HP.COM (Alan Bloom) pokes
a little fun at some of the strange CW call signs he has encountered:
>
>I suppose that a morse code fan would have liked being assigned my call:
>WA2ISE    all dits in the suffix!   .. ... .
>
>My favorite is the (at one time) very active contest station WB5EEE
>(known in some circles as "WB5S").  After the first dash in the "B", it's
>all dits:  .__ _... ..... . . .
>
>There used to be an operator at W1AW with the call WA9HHH.  On CW, this
>sounds like the error signal.   .... .... ....
>
I can go you one better.  I got baffled one night in a pile-up trying to
track the DX station's listening frequency (he was operating split).  Finally
I found out why:  there was a station hard at it in there with the call AA5NN!
A few weeks later I met the proud owner of this call and discovered it was
a very pleasant and friendly YL, Linda.  Well, as we got to chatting, Linda
told me she was a CW-only op, and had moved up to extra largely in the hopes
of getting a decent CW call.  You see, her general call had been N5DWN, and
every time she answered somebody they would QSY down 5.  I guess this shows
that the FCC, just like lightening, DOES strike twice in the same place.

The TH75 mod is pretty easy to perform. It might help to have the service manual handy to reference against the board layout diagrams on page 54.

Remove the front panel of the radio by removing the two screws next to the PTT switch, one screw on the opposite side of the radio, and the two front screws of the battery plate. Looking at the inside front cover, the lithium battery is at the top and the CPU just below that. Near the bottom left corner of the CPU is a short jumper wire. Using this as a reference, locate two surface mount diodes directly above the wire on the board. They are d3 and d4 from bottom to top.

```
              D4 ---|  cpu
              D3 ---|
     jumper wire>  |____   ---------
            W1                |||||||
```

D4 connects to the second pin from the bottom on the left of the CPU.
- Remove d4.

- Also cut the jumper wire. It's labeled W1 in the service manual.

This will give receive and transmit capability over the entire VCO locking range; 136 to approx 168 on 2M, and 385 to approx 455 on UHF. I did not try re-tuning the VHF VCO since that range seemed sufficient. On UHF though, I moved the range upward on my radio to cover from 430 to 473MHz; a little bit more useful segment. Getting to the VCOs to tweak on them is a bitch though, and I do not recommend trying it without the service manual. You will find also that you'll want to re-align the UHF front end if you plan on any serious work above 455MHz. The radios come tuned for the 430 to 450 range, and as such, sensitivity dropped to worse than 10uV at 460MHz. A little tweaking on L242 and L243 band pass filters solved that problem.

Happy out-of-banding!

Hello All!
I would like to thank everyone who replied to my last batch of questions. Your advice was invaluable. I have another couple of questions that I would like to ask. I got a lot of replies from people who thought that the Kenwood TS-440S with the automatic antenna tuner was probably the best buy. When I buy a linear amp, I assume that I can no longer use the tuner in the rig since it can only handle 100W and it will be in the wrong place anyway. I am right?

My other question reguards satelite operations; I read an article in the ARRL handbook about using the OSCAR satelites and it sounded very interesting. The information was a bit out of date and it didn't mention whether there were any satelites in geostationary orbit. What kind of equipment is needed to track satelites that aren't in a geostationary stationary orbits; and is this easy to do?

And now for the promised comments! I have read a lot of postings from hams concerned about the future of Amateur Radio. There is a lot of talk about the "no-code" license to encourage new hams to get on the air. I don't think this will have that much of an effect. I don't think Morse is that hard to learn, all it takes is a little time. I think the biggest factor stopping people from becoming hams is that most people have absolutely no idea what Amateur Radio is.

Both the ham stores in my area are not easy to find. So noone will just stop by just have a look, because you can't see them from the road. You very rarely see any mention of Amateur Radio on the television. I think that if Amateur Radio had a higher public profile, then there wouldn't be the need for lowering the standards to get more people interested.

Another thing that concerns me is the volume of insults that see to fly around airwaves at various times. For some reason, most of this seems to go on on the 20m band (I don't know if it is me, or whether it happens on other bands and I haven't noticed). This cannot do the service any good at all. If you want to attract people to the service, then there has to be a serious effort to curb this kind of behaviour.

Just picked up a couple FT-470's for myself and the spouse who just got her ticket a few weeks ago (N1HMW).

I really like the radio and am curious if it has additional capabilities.

To make a long story much shorter, if you have any mods or other information concerning this piece of equipment I would appreciate hearing from you and/or receiving it.

Thanks!
Noel

Don't know if there's an index on the net but what you want is real ancient history. I did some grinding back in the 50's to get a couple of rocks into the Novice bands (we use to be limited to Xtal control and 75 watts dc input then)!

I assume you have some FT-243 crystals or the old Blailey mounts in mind; these hermetics are a bear to work on, particularly the HC-18's and the little watch bar blanks. The mounted rocks are the easiest to work on, the hermetics usually have the electrical contacts plated on so you can't make them go very far. You mostly take material off a crystal, that makes the frequency go up. You can put a little pencil lead on to bring the frequency down but that usually ruins the stability and can "wear-off" after a while. In any case the activity often suffers from any work you do on the blanks.

If you are still of a mind to do this kind of work here is what I know. (damn little compared to some of the old masters)

Materials:

    a piece of FLAT 1/4th inch plate glass 9" x 9" is a good size
    some carborundum or diamond dust, grade 600 or 1200 grit is best
    distilled water
    solvent alcohol
    a cookie sheet
    several small cleaning dishes
    a CLEAN place to work

Procedure:

Remove the blank from the mount. For the FT-243 holders this can be done with a small screw driver. Take note of the assembly sequence so you can remount when needed. For the hermetic rocks you first unseal the can at the evacuation hole using a small soldering iron then unsolder the can around the base; be careful not to crack the base.

For the plane blanks you can grind the face but for the plated blanks as are more common now you have to grind the edges. The difference here is that you can move a blank further by grinding a face than you can by grinding the edges. If you are working with plane blanks and only need to move it a few hundred hertz then try cleaning the blank first and remounting it before you go to work, make note of the starting frequency and ending frequency. To clean, first rinse off in the distilled water and blow dry, then a couple of dunks in the alcohol and dry again. If you have access to an utlrasonic bath these are great for cleaning. One thing to mention is once the blank is clean DON'T TOUCH it with your hands. I guess you could use CLEAN rubber gloves or a pair of tweezers with a bit of neoprene on the tips to handle the blank. The reason for cleanlieness is that any dirt on the blank will lower the frequency and reduce the activity of the crystal.

As you reassemble the blank and holder (you did clean the holder too didn't you?) you can move the frequency by changing the spring tension of the holder though don't try to move it too much.

Now comes the real messy work. To really move a crystal blank you need to take material off the blank or put it on. Make a few pencil marks on the surface of the blank near the center to lower the frequency. Grinding material off the blank (face or edge) raises the frequency. Make a slurrey of the grinding powder and water, some people use a bit of "terps" to keep it from drying out. Put about 1/4th teaspoon of powder on the face of the plate glass and add a couple drops of water and mix to form a light paste about the consistancy of tomatoe soup or a little lighter.

If you are grinding the edges then determine the current angle of the edge and try to keep the blank at that angle all during the work. The plated blanks have usually been touched a bit and so have a flat spot on the edge, work there. Use straight strokes through the slurrey which you have spread thinly over the working area of the plate glass. Maintain constant pressure and angle while you work. Stroke parallel to the edge of the blank. After a 5 or 10 strokes on the edge clean up the blank and remount the crystal to check how far you've moved the frequency. Do this a few times until you know how many hertz per stroke you are getting out of this blank. Each blank will move at a different rate so forget about any rule of thumb.

Now if you are bolder you will be grinding the face of the blank. You need to work out how to hold the blank flat and parallel to the surface. A small piece of plate glass about 2" square will probably work. Spread out the slurrey with one face of the small holder glass, get things as even as you can. You may need more slurrey to evenly cover the holder glass. You don't want too much slurrey, only enough to be about as thick as the blank. Place the blank in the center of the slurrey, put the holder glass on top and maintaining even and ballanced pressure on the holder glass (try using a pencil eraser in the center) drive the holder glass and blank in circles to grind the blank down. Again start off in small steps, check your progress frequently and clean the blank and holder well. If you notice some loss in activity then reclean the blank, if that doesn't bring it back to life then you are probably getting the blank off axis. It's best to give up on a blank which has lost much activity as it will be darn near impossible to get it back on axix.

Anything else is cut and try, go find a real OH (some one from the the time before RF transistors) and see what they have to say about crystal grinding. I've got a fairly extensive collection of QST, CQ, 73 and Ham Radio (latter 3 from the first issue, QST back to 1928) I don't remember a lot of detail on grinding crystals, what I know I picked up from my Dad (licenced in 1919) who was one of those guys who could do or fix **ANYTHING**.

Good luck

Ron Todd, K3FR   the PATHFINDER guy

As a newcomer to ham radio, I am looking for some advice on purchasing my first rig, a 2m HT. I want to start with a couple-year-old used one so I can start operating without shelling out the bucks for the latest-and-greatest.

Features I know I want:
- Synthesized tuning
- DTMF pad
- Tone burst for repeater access
- At least a few freq. memories
- Power output on the high side of allowable range

- Rechargeable batteries with decent capacity and good replacement availability

What else should I look for? Could you suggest some models I should consider?
When I head to my first swapfest, I want to know something about what I'm
looking for. Thanks in advance!

Bryan Carpenter

There's a couple of Radio Control channels in there, the smart RC's don't
use them though because of the HF'ers and other pirates.

My guess is darned few, they don't even require Morse code for the First Class Boy Scout Rank anymore!! Can you imagine a couple of boys doing 7 wpm with a flag on a 5 foot pole? Hint: dots right, dash left and space down. My buddy (ex WV2LMQ) and I did it for the council scout-o-ramma, it takes a bit hustle but we could probably have done 13. I wonder if that would be an acceptable way for hearing impared persons to take the code test?

SAY *YES* To rec.radio.scanner (If it ever comes to a vote)

The topic of cordless phone monitoring is a bit controvercial. If you have any compunctions against evesdropping on your neighbors (legally, of course), skip to the next article.

On our local system, The Great White North UPLink (Public Access Unix), we not only have SIGS devoted to radio and scanning, but we have a cordless phone monitor SIG. Not everyone who owns a scanner will admit that they devote a lot of time monitoring 46-47 mHz for the pedistal transmitters of cordless phones, but I would say most folks with scanners have at least punched the range in just to see what is there.

With the addition of a good outside antenna (Like the CHANNEL MASTER 5094A) these signals can be picked up at distances over a mile, meaning that even in a small town you will get PLENTY of action on this band. In fact, you might find conversations stacked several signals deep during prime phone times.

Listening to cordless phone calls in the USA is still legal under the ECPA, from everything we have been able to determine. In fact, courts continue to uphold convictions for crimes committed over the cordless phone when a listener turns in a drug dealer, prostitute, or terrorist. (USE your own conscience, YOU have to live with yourself).

There are supposedly only 10 cordless frequencies in use here:

> 46.61, 46.63, 46.67, 46.71, 46.73, 46.77, 46.83, 46.87, 46.93, and 46.97.

Looking at this list, you see the pattern, and notice that there should be operations on 46.81 and 46.91, if things were "true to form". Well SURPRISE, SURPRISE.... There ARE some cordless phones on these two frequencies! Not many, but they exist. Technically these are illegal, but the old style cordless phones also sometimes wound up in the amateur 160 meter band, also not legal, but they existed. (Note, there is STILL activity to be had on the 1600-1800 band, though cordless phones THERE use FM. Your ham tranceiver switched to FM will do just fine, though modulation levels seem quite low here. I have found ONE local phone on 1740khz, and this is NOT an authorized frequency either. These older style phones are no longer made, but show up at garage sales and Goodwill stores all the time.

The handsets operate in the 49-50 mhz range, but you only hear ONE side of the conversation on these frequencies, so they are not practical, although this is a way to find activity where the pedistal is in the 1600-1800 range (MF).

If you have a PRO 2004 or PRO 2005, a handy thing to do is to program a range from 46.61 to 46.97 as a permanent search bank. Your scanner will search the entire range in just over a second, and you have the advantage of picking up units that are not on the "approved" frequencies.

NOTE: Recently the FCC gave the go ahead to double the channel capacity by splitting the channels by 5khz (46.615, 43.635, etc).

So much for the good old USA.

You might be interested to know that there are cordless phones in other countries, but things work differently.

In GERMANY, it is illegal to own a 46/49 type cordless phone (the USA type), though MANY people there do use them. The legal cordless phone system in West Germany is quite complicated, and offers the scanner owner a real challenge. Instead of the 10 (or 12) frequencies we have here, there are 1,800 channels in potential use in Germany. A cordless phone there operates in the 931-976 mhz band (way up there!) with a channel plan of: XXX.X10, XXX.X35, XXX.X60, XXX.X85) (25khz spacing). The German phones "hunt" for a clear frequency, so the phone NEVER is on the same frequency twice for all practical purposes. Using 5 khz steps, it takes 5 minutes to scan the whole band, so you stand a good chance of missing conversations. 50khz steps mean you will MISS frequencies, and 12.5KHZ steps do not seem to line up properly for some reason. The phones also are known to SWITCH frequencies in the middle of a conversation, if the caller is quiet for a while.

German legal cordless phones can ONLY be obtained (rented) from the PTT. You can not "own" one, as you can here.

NOTE: In Germany it is ILLEGAL to monitor cordless phones. In GERMANY it is illegal to monitor anything. Scanners are verboten. However, in practice, there are enthusiasts who DO listen.

Perhaps someone with a 2004 or 2005 might have ideas on how to make cordless phone monitoring a bit simpler in areas where there ARE so many channels.

I am curious about cordless phones in other countries. What bandplans, legalities, etc. apply to other nations? Is the USA the only country where it is legal (so far) to monitor low power unlicensed cordless telephones?

No flames please. It is a legal hobby here, and sure beats TV soap operas!

Just for grins and giggles, I called ICOM this morning, to find out what was up with the shipments of the R1. The rep told me that, at the moment, ICOM was concentrating on filling back orders for other equipment, and as a result, production for the R1 hasn't been ramped up yet. She discounted the rumor about the patent lawsuit, and also told me that the R1 is currently selling in Japan.

Incidentally, I talked to Dick at AES, and he said that the level of interest in the R1 has been phenomenal...

I have an old Kenwood 7850. A friend was telling me about some mod's to increase its frequency coverage (this request is asked so often we should assign a number for this request, we could have 73, 88, and 51--extend frequency coverage :-) He also told me about a fix to apply when replacing the finals (this is more serious).

He saw these in a newsletter from International Radio and Computer of Port St.Lucie FL. Of course, he couldn't find which issues they were in, he put the indexes in a _SAFE_ place... Anybody know of these?

PS: I am also looking for the Operator's Manual...

tnx

SAREX-II is a secondary payload on STS-35, currently scheduled for launch on May 17, 1990. It will be located in the Aft Flight Deck of the Space Shuttle Columbia. Ron Parise, WA4SIR, the Payload Specialist and astronomer on Columbia will be the Astronaut ham operator.

SAREX-II-02 is a secondary payload on STS-37, currently scheduled for launch on November 1, 1990. It will be located in the Aft Flight Deck of the Space Shuttle Atlantis. Ken Cameron, KB5AWP, the pilot of Atlantis will be the Astronaut ham operator.

The American Radio Relay League (ARRL) is the customer on the SAREX-II payloads. NASA gave its authorization for SAREX operations for the following reasons:

> To encourage our youth to become excited about science and technology, and
>
> To familiarize large numbers of the general public with manned space flight

NASA's intent in making astronauts available for SAREX operations is to involve the largest possible number of people, particularly youngsters, in Amateur Radio and the US space program. With amateur radio clubs and hams, our astronauts will speak over amateur frequencies directly with large groups of students, showing teachers, parents and communities how Amateur Radio energizes youngsters about science, technology, and learning.

You can easily become a part of this activity in your local school, as the astronauts will operate the SAREX equipment in the amateur two meter band. You will be able to send and receive messages via packet for periods of about 12 hours daily. The astronauts' work schedules will determine your chances for a voice or television message, but Ron and Ken may have an hour or more each day for these modes.

The Johnson Space Center's Amateur Radio Club station, W5RRR, in Houston, Texas, will re-transmit astronaut's signals to WA3NAN, at Goddard Space Flight Center, in Greenbelt, MD (near Washington, DC), and to W6VIO, at the Jet Propulsion Laboratory in Pasadena, CA. These stations, plus W1AW and several VHF and UHF repeater groups, will re-transmit the signals on most amateur bands so that you and the students can copy the communications. You will hear NASA Mission Commentary, frequent bulletins to advise listeners of astronaut planned transmissions, and all amateur two-way voice and amateur television transmissions with the shuttles. Using a simple hand-held transceiver, you can open the world of science to hundreds of youngsters. Students themselves can take part in the shuttle flight via a packet connection, and some will even be able to talk directly to the astronauts in orbit.

ARRL and AMSAT are co-sponsoring these exciting missions, with AMSAT heading up technical operations. Hundreds of Amateur Radio operators have already been working behind the scenes for months. The ARRL takes the lead with information and educational support. ARRL Educational Activities Branch (EAB) and NASA HQ will create lesson plans for teachers. All you need to provide is a 2-meter rig or a packet radio setup. If you are a teacher or instructor, contact ARRL EAB to get everything you will need and regular news updates. If you are a parent or a grandparent, contact ARRL EAB and a local school. EAB will send you materials, including ways to convince teachers and school administrators that Amateur Radio is an important discipline the school should take advantage of on a full-time basis.

This a tremendous opportunity for you to showcase SAREX 1990 and amateur radio to kids of all ages in a big way. Plan on being a part of it; contact ARRL EAB now and give your best to our exciting hobby and to our hope for tomorrow: America's youth.

Listen to the ARRL Bulletins on W1AW (see QST for CW and voice bulletins) on a daily basis; and to the AMSAT Nets on Tuesdays (U. S.), 3.840 MHz, 01:30Z to 03:00Z, and on Sundays (international), 14.282 MHz, 18:00Z to 21:00Z, +/- QRM.

[ANS would like to thank ARRL and NASA for this contribution. Stay tuned next week to the ANS bulletins for more details about the STS-35 mission and its amateur radio operations.]

The WA4SIR flight aboard the STS-35 flight of the Shuttle Columbia is still officially scheduled for early May 16th (GMT), although there are some hints that it might slip by one day. The SAREX mission will carry the packet ROBOT automatic QSO machine which will allow many amateurs around the world to have two-way packet QSO's with the Shuttle during the times when our ham astronaut, Ron Parise is busy.

To work the ROBOT, you transmit on 144.950 MHz and listen to the Shuttle on 145.550 MHz. Subsequent SAREX information bulletins will give you operating hints and describe the schedule in more detail.

If you are successful in making a two-way QSO, you call and your unique QSO serial number will be automatically logged and you will receive a QSL card after the mission. You will know you met all requirements of a two-way QSO by seeing your call in the QSL beacon which will be sent every 2 minutes and looks something like:

```
    WA4SIR>QSL <UI>:
    NI3F/186 WB2TNL/185 W3IUI/179 WB3AFL/177 NF3N/176 WA3EPT/175
    N4QQ/174 W3IWI/172 JY1/153 U6MIR/127
```

If you are heard by the ROBOT, your call will appear in the QRZ beacon which will look something like:

```
    WA4SIR>QRZ <UI>:
    #3405-NE3H NI3F K1LNJ WB2TNL WB3ILO N3ACL N3FWX WA3TSD WA3USG
    etcetera
```

where the #3405 is a serial number incremented every 2 minutes when the QRZ beacon is sent.

Unlike the QSL "worked" list, the QRZ "heard" list is not retained in the ROBOT and the laptop computer on the shuttle. In order to send SWL cards to those who were heard, it will be necessary to have amateurs around the world help to collect the list. When you are monitoring the WA4SIR SAREX transmissions, try to capture the beacons and send them in to us in machine readable format. We are only interested in the QRZ and QSL beacon information; please strip out everything else (like QSOs monitored, any other beacons, etc.). You may send it through the amateur packet network addressed like this:

```
     SP SAREX @ W3IWI.MD.USA
```

or via the Internet addressed like:

sarex@tomcat.gsfc.nasa.gov

and make the Subject: field contain the date/time of the beacons like:

May 19 @ 03:42z

Here are several hints that may help you make a successful packet QSO with the SAREX ROBOT that will fly with Ron Parise, WA4SIR in mid-May.

1. Frequencies: Your transmitter uplink frequency should be 144.950 MHz and you should listen for the shuttle downlink 600 kHz higher on 145.550 MHz. Under no conditions should you transmit on the 145.550 downlink!

Since there may be other packet or voice activity in your area on these frequencies, local coordination to insure a clear frequency during the ten day STS-35 mission may be needed.

2. Modulation: The uplinks and downlinks are ordinary AFSK/FM 1200 BPS signals, just like most terrestrial VHF packets. No special modems are needed. You are advised to check your transmitter's FM deviation and set it to 3 kHz or less. Most radios are typically set to 5-6 kHz and this will be too wide because of doppler shifts. If you don't have a deviation meter, listen on another radio and crank the tone level down until you hear the volume drop noticeably. Most people run too much deviation on their packet signals anyway, and you will probably find this improves the reliability on terrestrial paths too!

3. When to hear/work the shuttle: During the mission Keplerian elements and predictions will be sent frequently by WA3NAN, W5RRR, W6VIO, and many local FM repeaters, as well as by packet bulletins addressed to @AMSAT. Check with your local AMSAT area coordinators for information in your area. In general in the USA, the windows are in the late evening and early morning hours. Don't expect the SAREX hardware to be activated until the second day of the ten-day mission. Because the inclination of the shuttle orbit is only 28.5 degrees, the signals can only be heard between about +43 and -43 degrees latitude.

4. LISTEN!!!: Most packeteers don't listen to the BRAAAAP! from their radios, but you should listen during the shuttle activity. If Ron is personally available, he may turn off the SAREX packet hardware and be QRV on voice.

5. Connecting to the shuttle: All you do is to issue a connect. If you are heard, you will see something like this:

```
   cmd: CONNECT WA4SIR
   *** Connected to WA4SIR
   #191--- Tnx QSO with the SAREX Shuttle "ROBOT" automatic QSO machine
   *** DISCONNECTED
```

When the ROBOT hears your "ack" of its transmission, it will disconnect and you will be in the log. Because the ROBOT queues information for 3 seconds and sends several replies in one transmission, you should set your DWAIT to about 4 seconds.

6. Multiple QSO's: Once you have worked the ROBOT and make it into the log, no further QSO's from you will be logged (even if you use a different SSID). Give others a chance and don't connect multiple times!

7. Monitor!!!: Every 2 minutes a beacon addressed to QRZ will list stations heard recently, and the QSL beacon will list those worked. Every 3 minutes the Metabeacon (up to 1.7 kbytes in 7 packet frames) addressed to QST will send text describing shuttle activities. Monitor these beacons to keep informed. In Bulletin #1 we ask for you to submit copies of the QRZ and QSL beacons you copy.

8: Your chances for success: Signals from many hundreds of stations can be heard from the shuttle. With FM transmissions, only the strongest signal "wins", just like in a DX pileup. To help, the ROBOT can have up to 9 QSO's in progress at any one time. Perserverance and a well equipped station will help -- but if activity levels are high and the uplink channels are busy, it will be a matter of luck.

> I'd rather use a 1N34. :-)
>
>> Me too!

Not me. If I'm going though the trouble of making a crystal radio, why use a 1N34? Might as well use a commerical radio.

The whole point of a crystal radio (in my mind anyway) is the hunk of galena.

I plan to build a crystal radio, using state-of-the-art IC's for the *rest* of the unit. However, I already have bought my galena crystal (nice looking one too) at a rock-and-gem "show" (for a quarter not counting the entrance fee -- I was going there anyway).

Haven't figured out the mechanics to hold the safety pin yet. What's the optimum material for the pin?

Too bad the one I built thirty years ago (as a 7 or 8 year old) isn't around anymore....sigh.... :-)

From what I've heard and read, I've put together that digital cellular will be or has been allocated spectrum in or around 1600 MHz. It will be purely digital and not compatible whatsoever with the analog system. Since the existing analog phones cannot operate on 1600 Mhz, compatibility is moot. I also understand that LA will be the first place to see digital cellular since it is now the most crowded, followed by the other major cities as financial resources come available. I have not determined if the present dual-provider requirements will be part of the 1600 MHz digital system.

I've also heard that there will be dual technology phones available, which will be, of course, much more expensive, so that the user can choose between digital and analog. You would need the analog side just to be able to travel to places that don't have digital. The analog service, even in LA, would continue to exist for 10 or more years beyond the introduction of digital cellular. Can you say "poor man's cellular"?

I am curious, as digital cellular starts to get going, if salesmen will suddenly start promoting the security aspects of digital over analog? If they do before digital is available everywhere analog is, then they will be admitting that some people don't have a choice but to use a secure cellular system. Since digital will be more expensive, they will need to push it in some way. In places like LA it might be easy enough to push as a service with available channels. I understand the situations is a mess there now, with cell full situations causing no call completion and failed hand-off's.

My favorite is the (at one time) very active contest station WB5EEE
(known in some circles as "WB5S"). After the first dash in the "B", it's
all dits: .__ _... ....

There used to be an operator at W1AW with the call WA9HHH. On CW, this
sounds like the error signal.   ....

>Just for grins and giggles, I called ICOM this morning, to find out what was
>up with the shipments of the R1.   The rep told me that, at the moment, ICOM
>was concentrating on filling back orders for other equipment, and as a result,
>production for the R1 hasn't been ramped up yet. She discounted the rumor
>about the patent lawsuit, and also told me that the R1 is currently selling
>in Japan.

I talked to someone at EEB, and he told me that ICOM was recalling all scanners and EEB was pulling their ads because of a "patent problem". This he said was the unofficial reason. He said the scanners were still available outside the country. He seemed to indicate that there was a real reason the radios weren't available any more and a official reason that they were told to tell customers. Eather ICOM is giving you some BS or this guy was giving me the run around.
I also called Grove Enterprises and they confirmed that ICOM was no longer making the R1 available in the US.

The next time that you walk through a hobby or toy store, notice that many of the less expensive radio-control cars etc. operate on 27Mhz.

The unused channels are for radio-control.

What determines the top speed that you can copy CW in your head? Is it how your ears hear the interrupted pulse trains (mechanical) or is it how it's processed by your brain (software)? How about the inner ear (interface)? Why can some copy 60+ wpm and others only 30? Why doesn't practice make perfect? Or does it come down to the cold, hard facts that some people "have it" and others don't???

Check out the gadget AEA has on the market. It does FAX, and I believe it copies slow scan and sends slowscan. There should be an ad for it in the May QST.

Subject: Re: Heriditary Hams...

"7 wpm with a flag on a 5 foot pole". The way to speed up that mode of transmission is to use a shorter pole. The speed is limited by the time it takes to move the flag which has very high air resistance. By shortening the pole you reduce the path length for the flag. I normally use a 3 ft pole with a 2x2 flag. That is a lot easier to move over an extended transmission. I have sent around 10 wpm without serious problems, but it required hams at both ends. If you make a transmission error, it takes a lot of time for 8 dits. Speed average is blown away. Also, the normal (old Boy Scout) protocol was an ack at the end of each word. That takes two people at the receiving end to keep up the transmission speed - one working the flag and the other copying. Then you have to use a slightly modified form of block ahead transmission - start the next word before the previous word ack is received. With a little practice, it works quite well. I would guess, however, that in practical use, 5 wpm is going pretty fast. It works when nothing else does, but it sure is easier to reach over and grab that HT.

>
> An old variation on a cat's whisker was a "coherer"; this was a glass tube with metal chips. When the rectification failed, one simply shook the tube to change the chips' contact points.

Coherers don't work by rectification, they work by cohering.

```
          ---------------------         <-glass tube
ant--o------|:.:.:.:.:.:.:.:|----o--gnd <-electrodes, connected to antenna
     |    ---------------------  |      .:.: iron filings
     |                           |
     \----battery---headphones---/
```

The loose agglomeration of iron filings in a coherer had a high resistance; an increase in current from the antenna would cause the filings to "cohere" and the resistance would drop suddenly, causing an audible click in the headphones. To detect the next signal, the tube would have to be tapped to loosen the filings again. Automatic decoherers were invented to help out: the increased current flow through the coherer would trigger a

small solenoid which would tap the coherer, thereby setting up for the
next pulse.

Some weeks back, there was a discussion on the list about Heath, and several of us mentioned that we filled out a marketing survey from them and sent it in with letters of comment and suggestion. I just thought I'd mention that I just received a letter of acknowledgement from Heath, singed by "Lisa Tarpoff", a marketing research analyst there, thanking me for my comments. So it appears that at least someone is reading such letters.

Regards, Will

Bravo! You hit the mail right on the head. It's the chicken-and-egg problem -- No one knows we're here, so no one joins, thereby reducing the attractiveness of the market to potential retailers, which results in hidden stores, which no one can see, so no one knows we're here, etc., etc. :-(

> Another thing that concerns me is the volume of insults that see to fly

DX's today (may 7 1990) we are going to transmit with special prefix from the Pope Juan Pablo II during the visit to Mexico, the frecuency is 14226Mhz in the family hour.
The special prefix is 6DAPAX this prefix it will be operated by the Radio Club Azteca from: Mexico City, Puebla City, Cuernavaca Morelos & Mexico City's metropolitan area.
Today's operators:

6DAPAX oper. XE1LD QRA: Raymundo Lopez Ayo
6DAPAX oper. XE1KH QRA: Mss. Carmelita de Lopez.
6DAPAX oper. XE1OZG QRA: Oscar.
Sorry...XE1ZOG not XE1OZG...
6DAPAX oper. XE1MLG QRA: Mario.
6DAPAX oper. XE1RHZ QRA: Hector Rodriguez (Mexico City.)
6DAPAX oper. XE1SRA QRA: Hector Rodriguez Jr. (Puebla City)

Those are the today's operators With this prefix.

Coherers; yes they need a mechanical shock to restore the high resistance state. The Science Museum in London had a fine collection of these in the 'sixties. Some used metal filings, with a clockwork (yes, wound-up-spring!) mechanism that tapped the filings in the tube at regular intervals to de-cohere it. Another had a trembler mechanism like an electric bell, with the armature tapping the filings. There was also the 'mercury wheel' coherer - a metal disk mounted above a pool of mercury in a dish, so that the wheel just touched the mercury. A thin film of thin mineral oil was then put on top of the mercury -this formed an insulating barrier between the disk and the mercury. High-frequency voltages broke down the oil-film, so the device conducted. A clockwork motor rotated the disk slowly (so as to bring a new film of oil between the disk and the mercury and achieve 'de-coherence'.)
I also have dim memories of a coherer using two metal balls separated by an oxide-film and mounted in an evacuated bell-jar; also i guess that bio-galvanic mechanisms could have been used: wonder what the DX record is for a pair of frogs legs?

One way to change the frequency of a crystal is to use chemical methods; a solution of hydrofluoric acid will etch the rock (making it thinner so raising the frequency) whereas it is also possible to plate materials onto the rock electrolytically. This lowers the frequency by loading the rock.
Hydrofluoric acid is hazardous stuff; if i had any, i would run away quick!

I would not recommend using it, specially in unskilled hands. It dissolves glass in a most spectacular way. Likewise human flesh, clothing etc.

Plating a rock is easy; use copper sulphate solution, 0.1 molar. Link both the electrodes of the crystal together, and dangle the rock into a beaker of the solution. Hang a copper wire into the beaker too, making sure it does not touch the rock. Connect a variable-voltage power unit to the wire and rock (anode is wire, cathode is crystal). Give it about 10 milliamps for a minute or so, take the rock out, wash it in industrial alcohol to remove any remaining solution, dry it off, then put it in circuit and see what frequency you hit. Repeat this until you get the right frequency. Of course if you go too far, you can reverse the polarity of the supply, and strip off some of the plating. Beware though; activity falls as you increase the plated-on loading, and cannot always be restored by the reverse-polarity trick (because the plated-on material is not deposited evenly).

I shifted a HC6U rock from 7055KHz down to 7001KHz this way (i was aiming for 7000KHz but could pull it the last 1KHz with the trimmer). It seemed to still have reasonable long-term stability (drifted about 2KHz high over 5 years).

And then there was Jack Colson, W3TMZ. When Extras were given the chance of picking a two-letter call of their choice, Jack picked W3OZ.

```
W3TMZ   . _ _   . . . . _ _   _   _ _   _ _ . .
W3OZ    . _ _   . . . . _ _   _ _ _   _ _ . .
```

However, when one could no longer hold twe calls, he chose to give up W3OZ!
How about K2RTH, also known as K2R6 by the way he sends it.

Many people couldn't understand why W3EIS turned it in and got a 2-letter call

One of the problems in making twin lead J poles is that not all twin lead is the same. Low loss twin lead has a different velocity factor and hence the lengths are different. If possible check out the J pole on a network analyzer to find out what its resonant frequency and impedance is.

Well, gee, why not build a totally digital crystal set? For the detector, you'll need an XOR gate, a flip-flop and about two feet of wire. Connect one input of the XOR gate to a square wave generator at the carrier frequency (Fc) of the station you intend to receive. Connect the output of the XOR to the other input with the two feet of wire, arranged so that you can vary the length of the wire. The output of the XOR gate will be very narrow pulses at Fc. Connect the output of the XOR to the trigger of the flip-flop. Adjust the two-foot hunk of wire until the flip-flop triggers about half the time-- that is, make the pulses so narrow that they fail to trigger the flip-flop half the time. By connecting an antenna to the trigger of the flip-flop, you can let RF energy vary that triggering percentage, and the output of the flop will vary with the instantaneous modulation on the signal. Of course, you need a low-pass filter and audio stage; a small speaker connected to an output of the flop will serve nicely.

Please note that the device described above does not meet Part 15 specifications concerning spurious emissions.

CEO summary:

I'd advise against using them for all but low power transmitters. I have had personal experience with one and it has a very narrow bandwidth, so the SWR rises very quickly as you change frequency. I also know a commercial radio dealer who tried them and then offered me the 5 remaining ones, free! His comments were along the lines of "burns up real quick," but remember, this was commercial gear with 30 to 100 watt output. The cellular guys seem to get away with them but they're only running a watt or two. Don't know how they get wide bandwidth...

(I punched a 3/4 inch hole in my roof and put in a Larsen NMO mount and a 1/4 wave spike...ran the coax down the front roof pillar to the radio. Done it that way in 3 Japanese cars. Power for my 25 watt rig comes from the cigarette lighter (I don't smoke) and the rig is installed where the ash tray used to fit.)

Whichever way you go, I'd suggest putting "anti-seize" compund (a greasy material with flakes of metal in it...available at auto parts stores) on all threads exposed to weather and on the whip element where it enters the clamping socket. Seals against water (and salt) getting in there and corroding the connection...thereby raising SWR. Silicone grease on all "o" rings, of course.

>the country. He seemed to indicate that there was a real reason the radios
>weren't available any more and a official reason that they were told to tell
>customers. Eather ICOM is giving you some BS or this guy was giving me the
>run around.

Another call to ICOM [(206) 454-8155] and the Amateur Radio Sales Rep was
made. Again, she she said that the problem was production, and that there
was no plan whatsoever not to market the R1 in the US.

>I also called Grove Enterprises and they confirmed that ICOM was no longer
>making the R1 available in the US.

Well, she also talked to Bob Grove, and he in turn relayed EEB's comments.
She has no idea what's behind EEB's move, and that she told Grove that they'd
be shipping Real Soon Now.

Calls to AES and HRO revealed no plans to stop marketing.

Doug, something truly strange is going on here. Somebody isn't telling the
truth; either EEB is hallucinating, or ICOM is full of it...

I also had a problem as you described above.

What I did to resolve it was to turn down the volume, disconnect the audio-in or set the DCD Threshold to a point where the CD light doesn't come on.

Then reinitialize the I/O.

Works every time for me. PK-232/MBX with PC-Pakratt.

I suspect that having active data transitions while it's trying to initialize just blows their firmware's mind..

hope this helps
later
frank

My call sign is a real turkey in Morse (WB9QLR) and little better on phone.
My first name, however, has a nice swing to it, since after the initial
double dah, it alternates:

_ _   · _   · _ ·   _ · __

Haven't run code in years, but thought I'd throw in my .02 worth. On top
of that, I can't think how many times people thought they heard an extra
dah on my last name and called me "Mary" - instant gender change :-)

I suppose that there must be similar circustances in a lot of other cities
in the country ie apparently only 1 or 2 UFH stations in town.
I also live in Rochester and have recently noticed a new rather weak signal
on the air on channel 38 signing W38AW. On questioning a few people locally
I find it is a new low power (less than 1,00 watts by FCC definition)
Commercial TV station. The local FCC people did not no a great deal about
them except that there are a large number of construction permits for these
type of TV stations already issued, and an even greater number of potential
applications pending. The stations according to the FCC are meant to have
a range of 10 miles, but must not cause interrference with other channels.

Anyway I guess the bottom line is that vast wasteland of UFH that appears
to be currently unused in many areas may be very soon be consumed by the
allocated users. All of this will undoutedly put an even greater pressure
on the Ham bands.

PS anybody have some more info on these low power TV stations ?

I posted this question a week ago or so, but I don't think it made it out...

I'm looking for any thoughts/opinions/experiences with on-glass antennas and tinted windows. Specifically I have an Antenna Specialists 2-meter glass-mount and a Chrysler mini-van with the factory "sun-screen" windows. Has anyone tried this combination or anything similar.

I'm concerned because the antenna came off my Monte Carlo last year 'cause everytime I keyed up, the cruise control turned off. There was no way to mount the shoe on the rear window without straddling at least one defroster wire... the salesman claimed that it didn't matter, just center the shoe between two wires and it would work fine (so much for my faith in instruction manuals and salesmen).

I heard somewhere that some company makes an on-glass antenna that has a groove cut in the shoe to allow straddling the defroster wires... Does anyone have any idea who this might be?

Thanks,
  Mike (KA9WSB) [mike.westerhof@Central.Sun.COM]

I was looking at an ad for the new AEA antenna ad in AES's latest
catalog, and I'm slightly intrigued. It's another varient on the
small capacitively tuned loop idea- just a loop and a big remotely
tuned capacitor mounted on the roof (or tower, or whatever).

Has anyone played with this thing yet, or perhaps with other varients
on the same idea..?

In a completely unrelated matter: I apologize in advance for asking on this
list, but since I have run into a number of blind alleys and this group
has so many educated technical types....:

I need a software package- micro (IBM, Mac) or mainframe (IBM), object or source, for monitoring our University's compliance with NRC license requirements regarding radioisotopes. It should keep track of who's got what, compute decay rates and so forth. I'm sure there's something out there better than the awful FORTRAN program someone wrote here 20 years ago...and I don't feel up to writing another one :). Thanks...

The crystal set that has been diagrammed in the Cub Scout handbook forever DOES NOT WORK because the sliding coil-tap makes shorted turns. Kits were even produced, and they didn't work either. I suspect the original author never tested it.

It's about time they published something workable, using available parts. There have been lots of excellent but simple crystal-set articles in magazines like _Popular Electronics_ since the '60s. Does anybody out there have connections with the BSA publishing establishment?

Back in the good old days, I got a half-dozen surplus crystals right at the bottom end of the 40 meter Novice band and ground them up using a piece of plate glass and a "slurry" of water and Ajax cleanser. This works OK if you are only trying to move the frequency 20 or 30 kHz, but it does tend to reduce crystal activity if you are not careful. The trick is to try to keep the two crystal faces exactly parallel -- in other words, try to make the grind as even as possible.

I had heard that toothpaste works well for crystal grinding. I could never make it work. Perhaps a "whiter than white" abrasive-type toothpaste would work better.

Good luck!

Posted: Wed May 9 17:43:52 1990

Many of you may have noticed the sharp drop in the solar flux this month (down to 121), and wondered what's going on with sunspot cycle 22 !

Are we headed back down already ? Will 10 meters be any good this fall and winter ?

By using solar flux data from the SESC (given to me by W1GD), I have examined the current sunspot cycle, and have tried to make some comparisons with the previous 3 sunspot cycles.

To examine the sunspot cycles, I have taken a 12 month running average of the solar flux numbers. I call this the "smoothed solar flux". This tends to damp out the day-to-day and month-to-month variations that confuse the issue !

Cycle 22 (the current cycle) rose monotonically until June, 1989, peaking at a smoothed solar flux of 214. The smoothed solar flux stayed at 213 or 214 from June 8, 1989, until July 12, 1989. From mid-July, until November, 1989 (the latest date from which a 12 month running average can be constructed), there has been a downward trend in the smoothed solar flux. The flux has been between 205 and 206 from September 12, 1989 until the most recent date (November 6, 1989). This represents a 9 point drop from the peak. Another way to look at the peak interval is to examine the interval of time that the flux was within 9 points of its peak value. For cycle 22, the smoothed flux was 205 or greater from April 17, 1989 until the "current" date of November 6, 1989 - an interval of slightly less than 7 months.

Now, a comparison with previous solar cycles:

Cycle 21 rose monotonically until April, 1980 (smoothed flux = 199), then dropped 3 points, then rose to a smoothed flux of 201 in October, 1980. Cycle 21 then dropped 6 points, before rising to the cycle peak of 204 in April, 1981. There was then a 4 point drop, followed by another cycle peak of 204 in September, 1981. Finally, cycle 21 dropped rapidly.

Cycle 21 was within 9 points of its peak value for an interval of 25 months.

Cycle 20 was bizarre ! There was no pronounced peak. The smoothed flux maximum was only 156. However, cycle 20 was within 9 points of its peak value for an interval of 40 months.

Cycle 19 rose monotonically until June, 1957 (smoothed flux = 233), dropped 2 points, then rose to 243 in December, 1957. Cycle 19 then dropped 2 points, before rising to the cycle peak of 245 in March, 1958. The flux fell rapidly following the cycle peak. Cycle 19 was within 9 points of its peak value for an interval of 9 months. However, cycle 19 had a smoothed solar flux above 200 for 33 consecutive months !

Observations:

It seems that the higher the absolute value of the maximum smoothed solar flux, the more "peaked" is the cycle (a faster rise and decay).

If cycle 22 has already passed its peak, it will be remarkable in terms of the short length of time it was near its peak value. This tends to imply that perhaps cycle 22 has not yet reached its peak value.

On the other hand, cycle 22 has already dropped 9 points from its peak value. None of the other 3 sunspot cycles that I compared against had dips of more than 6 points before rising to the cycle peak. The 9 point drop of cycle 22 seems to imply that we are past the peak.

Conclusion:

The jury is still out on cycle 22. Only time will tell !

Steve, N2IC/0

Well, folks it appears that the ICOM R-1 was either vaporware or just couldn't be sold in the U.S. The ICOM folks at Dayton said the radio has been "cancelled indefinitely" and EEB says that they may still get some someday. EEB said ICOM was citing "production problems" as the reason for cancelling the receiver.

What's interesting is that ICOM ran a back cover ad on the May issue of Popular Communications advertsing their new receivers. EEB (a major ICOM

dealer) had also run ads for May, 1990. The people at EEB sounded really
annoyed at ICOM for pulling this rig so suddenly. I sense a production
yield or tariff problem here. I personally think the radios exist and they
and they can't get them into the U.S.
This is a Stone Cold Bummer :-(:-(. I was really looking forward
to that radio.

Anyone else heard anything?

> new digital cellular system. Lots of people who own the presently available
> analog cell phones are not going to rush out and buy a brand new digital
> capable cell phone......they have already made an investment in equipment
> and are going to want that equipment to continue to work.

An article in Mobile Electronics has said that there will be dual mode phones
available because people won't want digital only to begin with. They mentioned
that even if digital can be made as cheap as analog, which is not expected,
that the dual mode would still be even more costly. Yet for some who really
want a channel in downtown LA at rush hour, the cost might well be worth it.

> Also, analog only phones will probably be available for some time after the
> digital capable phones come on the market....the digital capable phones will

> consumers.

I can believe this.

You might even see salesmen telling customers that the new digital cellular
is even "MORE SECURE than analog", even though analog is still "completely
secure".

> The plans that I have read about will use the standard cell freqs with an FDMA
> scheme, and will multiplex four digital voice signals onto one present 30 KHz
> channel....a kind of FDMA/TDMA system. Each of the new digital cellphones will

> original specturm phones (666 channels).

And what is the slicing rate? That automatically forces a wider signal if it
is very high. They cannot slice ABOVE the audio range as that would splatter
all over the place. They will have to packetize somewhere in the 100 hz
range.

> The digital cell phones will also be capable of using the analog system, and
> will be agile enough to switch quickly so that a user is not even aware

Would be a nice feature. But surely they can do this on two cellular bands
as well.

> Initially, digital will probably only be available in the most dense urban
> areas, and only a few channels per cell will be assigned to the digital

> in major urban areas, and in some rural areas not yet, if ever.

I would hope this is the approach they will take.

> Also, I read that the first tests of compatible digital cellular were
> succesfully carried out.....digital is on its way!

But what about the salesmen who lie about security?

  Sb: Kenwood TM 731A Function Beeps

  I found no mention of how to disable those irritating status and function
  beeps in the manual supplied with this rig, and stumbled across it by
  accident.
  1-Turn rig off.
  2-Depress call key and hold.
  3-Turn rig on.
  4-Release call key.
  This will ensure your sanity under any and all operating conditions.

I do now know much about Ham-Radio and I just want to know how I can communicate with my friend in korea thru ham-radio.
Is the novice license enough for me to talk to me friend in Korea?
Do I need to buy a very good radio since Korea is so far from USA?

This is a reply to the spate of Yaesu bashing in this thread. While I have owned every Icom radio imported into this country at one time or another, the radio that regularly hangs on my belt is a Yaesu FT470. This radio has been dropped on cement, stepped on, sat on, and dropped in water yet it continues to function perfectly. It has more USABLE features than any handheld that I have ever used. In side by side comparisons with my IC2AT, u2AT, and IC4AT, it wins in sensitivity and is no worse in intermod performance than my IC900 mobile rig. It has a METAL case that doubles as it's heat sink (yes it can get hot if you yak a lot on UHF with the 12 volt battery pack). It has the best night illumination of ANY handheld, even the TTpad keys are backlit. The scaning system is the most flexible I have seen. The ability to work duplex is superb. It will act as a crossband repeater with NO mods. I have only two complaints, the belt clip supplied is too flimsy--use an ICOM clip -- and the internal speaker is too small and inefficent--use a headset or earphone. If Yaesu fixes the audio and supplies a stiffer belt clip, this would be the perfect handheld available for $396. Icom makes excellent radios even if they are stodgy and pricey, and Kenmore (er Kenwood) makes some cheap HiFi equipment, but for the best HT for the money the FT470 has no competition.

Is anyone aware of a program to interface my IC-765 and Mac through Icom's computer interface? If so, please describe the program and advise of how I could obtain it.
Tnx and 73 de Ken, W8LU

In article <30500530@ux1.cso.uiuc.edu> phil@ux1.cso.uiuc.edu writes:
]The rumors on this will go on for a while. When the radio does ship
]in the US, its features or lack thereof will tell some of the story.
]If the cellular frequencies are removed, then I personally would urge
]that the radio be boycotted as a form of counter pressure to the
]manufacturers to convince them that buckling under to pressure from
]other sources is not to be taken trivially. There is no valid reason
]to delete any frequency range in the receiver.

Errr.... if they make it trivially easy to restore the coverage (remove a diode or chip resistor), then I see no reason to flame them. They (and we) get the best of both worlds: the cell phone profiteers are satisified and don't further screw things up; and, we still have full coverage.

I would point out that the cell phone profiteers had enough power in 1986 to get absurd provisions added to the ECPA. They could do it again if sufficiently threatened. How would you like them to buy congress to pass a law that said: "Import, manufacture or modification of a receiver which results in a capability to receive the xxx-yyy frequency range is a class x felony" or some such rot?

TWO SCANNER PATENTS

by Bob Parnass, AJ9S

Here is the information I published a few years ago about two of the scanner patents held by General Research Electronics (GRE), makers of most Radio Shack scanners. You can find out this type of information by spending a few minutes in your corporate or academic law library.

A Channel Lockout Invention

Almost every model scanner sold today provides a way to bypass, or "lock out" channels from being scanned. It wasn't always this way. The first Bearcat scanner, a crystal controlled model with a row of red lights, had no lockout provision.

On February 26, 1974, a U.S. patent was granted to a Japanese citizen for a "frequency skipping system" for scanning receivers. Patent 3,794,925 was granted to Kazuyoshi Imazeki, of Tokyo for a "Frequency-Skipping System for a Signal-Seeking Receiver."

Filed almost two years earlier, Imazeki's development was described as a "switching network" operable "to cause the scanning circuit to skip those frequencies which the operator does not want to monitor."

The need for a lockout circuit was evident: "in some situations the operator may not be interested in receiving one or more of the channels. Unless some provision is made for skipping these undesired channels, the system automatically tunes the receiver to them whereupon the operator must either listen to the undesired channel until it goes off the air or manually advance the receiver to the next channel."

Earlier lockout schemes had drawbacks. The circuitry was "relatively complex and expensive" and had "the further disadvantage of requiring almost as much time to skip a channel as that required to tune to, and through, that channel. In a system having ten or more channels of which only two or three are of interest to a particular operator, a relatively substantial amount of time is lost tuning through the 'skipped' channels."

An example of this slower scheme was the way the Heathkit GR-110 scanner accomplished lockout, by merely providing a switch in series with each crystal.

In Imazeki's scheme, an extra clock pulse was applied to the scanning counter circuit when a locked out channel was next in the scan sequence. This innovation allowed faster scanning of desired channels, by forcing the scanner to the next channel.

The patent assignee is General Research of Electronics Inc.

Priority Scanning Scheme

It was 16 years ago last month that a U.S. patent was granted to a Japanese citizen for a priority scheme for scanning receivers. On April 2, 1974, patent 3,801,914 was granted to Kazuyoshi Imazeki, of Tokyo for a "Priority-

Frequency System for a Signal-Seeking Receiver".

Filed almost two years earlier, the system provided for a "signal seeking receiver to automatically tune" ... "to a priority signal whenever it is received. During non-priority receiver operation, a scanning circuit causes the receiver to automatically scan a plurality of predetermined frequencies and tune to a received signal have a frequency corresponding to one of the predetermined frequencies."

In Imazeki's scheme, a low frequency priority oscillator periodically halts the scanner's clock circuit, interrupting the normal scan sequence. The priority oscillator's output is also connected through a multi-position switch, which allowed the user to designate an arbitrary channel as the priority channel.

The circuit diagram in the patent looks familiar. That's because it forms the basis for the priority feature found in many crystal controlled scanners. The assignee is General Research of Electronics Inc.

WERE SCANNER MANUFACTURERS PRESSURED TO LIMIT FREQUENCY COVERAGE?

by Bob Parnass, AJ9S

The 406 - 420 MHz band has long been used by federal government agencies for communication of sensitive information. Until just a few years ago, this range was not receivable on programmable scanners sold by Electra (Bearcat), Regency, or Radio Shack.

Speaking at a scanner club meeting in Berkeley, Illinois, an engineer from Electra confirmed the rumor that it was US government pressure which persuaded scanner manufacturers, eager for timely FCC Part 15 certification, to omit this band from their models.

Tradition was broken in 1982 when Radio Shack imported the 2020 scanner, made by General Research Electronics of Tokyo, which featured coverage down to 410 MHz. Sales literature for JIL's imported SX200 even went so far as to openly tell customers that they could "Tune Military, FBI, ..., DEA, Defense Department, Justice Department, plus other restricted radio bands no other scanner is programmed to pick up."

Not to be outdone by the imports, Electra introduced its American made Bearcat 200 with coverage to 406 MHz. Regency, whose American scanners were spec'd down to only 440 MHz, made service manuals available which revealed coverage below 440 MHz was possible on all its programmables by simply striking the "." key before entering the frequency digits.

Today, government agencies are using digital voice scrambling and spread spectrum techniques to ensure privacy of sensitive communications.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

```

I have had good luck with both Kenwood and Yaesu (TH-21AT and Ft-411). The 411 uses the same battery packs/accessories as the Ft-23. I also prefer the smaller HT's so that I can carry them in my pocket. Because they are small, I can take them on lots of occaisions where I wouldn't want to have a radio hanging off of my belt. Several times I have forgotten that it is there!. Five other people here at HP in roseville have the Kenwood TH-25AT and are very happy with them. One person has both the TH-25At and the FT-411 in his family. The father prefers the TH-25AT and the son prefers the ft-411. One problem I have worried about with the newer radios is that they in general are more suseptable to intermod and interference because of the wide recieve coverage. I would think that it would be harder to keep IM and interference down on a front end that tunes 40MHz than on a front end that only tunes 4Mhz.

I guess my advice is; figure out what your requirements are and then talk to as many people as possible with different radios as possible. (I would have looked at ICOM more seriously when I bought my Ft-411 if I could have found someone that had one in my area!) If they will let you, play with the radio and see how it feels and how easy it is to operate, whether the controls are solid and in the right place (especially if you are left handed!). Don't forget to ask people where they bought it and if they have had any problem with service.

Last of all, when you get your radio, BUY THE SERVICE MANUAL. They usually cost about $15 and are well worth the cost even if you don't intend to work on it yourself. Buy it now, not three years from now when somthing breaks, the service center is out of copies and has to order it from Japan, or the local dealer says "Gee, I could fix it real soon, but I don't seem to have the service manual for your model .....". The manual is also good for figuring out what that extended receive/cellular/more memory/RS-232/etc mod really does (This may take some work , the manual gives you clues, not answers).

Good luck,

Stan

I have heard something about a new antenna called Crossed Field Antenna. This antenna is said to be as good as ordinary antennas, but is very small in size, and can be placed in the desk, at a window. Is there anybody out there, who has tried this kind of antenna?

Hi!

I talked to the Swedish ICOM rep. (Swedish Radio Supply) today about the availability of ICOM R1 and R100. They have starded shipping R100s to their customers now, and expect the first batch of R1's in the beginning of June. The person I spoke with didn't expect any trouble in getting the R1 (they are getting the radios directly from Japan).

They have orders on the R1 covering two months of deliveries so if I order one now, I will get it in the end of July.... There are also a shortage of R100's, one month delivery time there.

If ICOM in the US are having trouble, perhaps there is a possibility for some of You to buy japaneese radios from Europe :-) SRS are accepting major credit cards etc.

(No - I am not paid by SRS to say this, I'm not even sure they're selling things overseas.)

Unfortunately, this is not currently permissible. Internet permits the seven bad words, commercial messages, and any other form of free expression.

Under FCC rules, an Internet (as in the existing DARPA Internet) Gateway would need *amazing* computational power to filter each message and determine if it was commercial for sale junk, bad words, etc.

We were interested in using packet to distribute the UseNet BBS type of news system that exists on the Internet. While the technology was not a problem, even for 1 MegaBit Links, the Rules were a definite obstacle.

Would these patents only apply to scanning RECEIVERS or would they also apply to scanning TRANSCEIVERS?

I have a Motorola Saber-III HT that scans with _Dual-Priority_ and _Lockout_ capabilities. Motorola calls this "SaberScan" (of course they also have scanning on their other radios) and has a TM on the name. I wonder if they must license the use of PRIORITY & LOCKOUT?

Also, IMHO, "PRIORTY" is a poor choice of wording for scanners & amateur radios that check a predetermined frequency once every X seconds. I have seen this from 2 to 5 seconds, never faster. Commerical gear, on the other hand, samples the pre-determined frequency several times a second allowing the operator to hear the entire transmission instead of the trailing carrier or "hang-time" of a repeater.

Most things. There are a couple of labels on the keypad that you can't
see, but they aren't terribly important.

A nice feature of some Icom HTs is the way the lamp stays on for a time
after pressing the lamp button. I wouldn't mind this feature on the my
470.

These patents describe circuitry techniques to achieve certain goals that
are no longer needed with today's microprocessor controlled scanners.

A feature such as skipping or not skipping a single channel is actually
rather primitive considering what could be done in software these days.

I would like to know what level of technology that is used in the radios
used by the secret service agents when they are covering the president,
vice-president or other important white house staff. I would suspect they
use the low 400 Mhz frequencies. Can someone confirm?

I need some help from the interference gurus out there. I am trying to set up a portable packet station using a kenwood th-21at, a heathkit hk-21 tnc and a portfolio. The problem is that the portfolio creates a whining sound right around 145.01 and 223.5 Mhz. I doubt that anyone has specific info on the atari but how about some general idea on supressing computer interference that are applicable to the portfolio. I know that the computer is the culpret through the process of elimination, and the realy nice part it that it only interfers when running a program, especially the term program for it. I am going to try some other programs but it's serial port is not quite standard at the low level so I doubt that they will work, also they (the other programs) are very big. The term program for the portfolio is just over 2k and includes xmodem file transfers and programmable function key strings. Oh well, any help will be appreciated.

Not to try and propagate any ill feelings or anything here, but I bought an
MFJ half-wave telescoping antenna for the HT last year for about $16. Though
some will say it doesn't help any because you don't have a ground plane, my
transmission and reception improved dramatically (ANYTHING beats the ol'

stubby dummy load!).

Well, I had this for only a couple months before the antenna came separated from the connector!! This was long, long ago, and I decided to just blow it off thinking how much trouble it would be to get a replacement. Now I think I would like MFJ's address, because I think they may be interested in good PR and might actually ship me a new one. So...

Anyone got the address?? Any stories about how "friendly" they are?

Thanks!

Mark C. Lowe - KB5III

Kenwood makes mediocre Hi-Fi, not too cheap (Yorx from Taiwan is cheap :-) Kenwood once makes the best affordable tuner for Hi-Fi, you ham guys should guess the reason of Kenwood experience of RF manufacturing, and instuments like scopes.

I'm disappointed about the audio of FT470, I wish they fix it since the FT23! Is it better than FT23 though?

how is it compare to the IC24? audio? freq. range? functions?

73,

David

Reminds me what a nut I can be/am while at the local Ham Swap Meets. And yes, this might be a long story and no Scott, it has no point.

Being an avid buyer, I lack the spirit in the sales arena. But for a few months I did manage to get out there and try to hustle a buck. To whit, I rounded up most of my boat anchers and fork lifted them into the family ride and trucked off to younder arena at O'dark thirty O'clock in the morning.

...stuff and 3 wasted hours deleted...now the sun is out and I haven't made even coffee money yet. Well, I thinks that maybe these lead piles (did I tell you that these are Motorola Motracs, L recievers?) are getting the proper exposure sitting next to me, stacked 8 high. So I take one of 'um and move it out into the isle, so that folks would, well you know, sorta trip over it and discover precious cargo beneath their feet. Well, it worked right off in broad (sorry, BRIGHT) daylight. This guy picks it up and brings it back to me. What an idiot, he didn't wanna buy it. He thought somebody moved it. DAMB right! I had to lug the pile back out into the roadway. Always some yuck out there tryin' to screw with the advertizing.

Meanwhile, back at the sales lot. Another guy pulls it over to the other side of the seller's space. To my competition no less. Well Chuck is mad now. He's sellin' Micors and some CHP pull-outs with repeater options and he don't like my stinkin' Trac trashing up his neighborhood. He chucks (no pun) it across the road at me. Suc{er wieghs better than 80 pounds. Shoulda blown his arm out, but life's not fair. So I got my Trac back less some heat sink fins. I discretely placed it back into it's normal display location and

more stuff deleted.....

we had great giggles with that Trac. Guess you had to be there to get the idea of how much entertainment from folks tripping over a wayward Trac. Anyway, I wanted to leave the Tracs (all of 'um-didn't sell any) for the management to figure out, but Chuck sez he didn't want to get blamed for the waste, so I took them back home. Figure to use them as cornerstones on my next house.

Then there was the old boat-repeater that I bought just for the cabinet.
Weighed over 200 lbs with the junk technology inside....but that's a longer
story and has no point either.

I have just received information on a new AOR scanner AR1000 that features
such things as 1000 channels in a hand held.

Does anyone have experience with AOR scanners and could compare them with
others in their class

I am looking for QSL routes and/or addresses for some stations I worked during the CQ WPX phone contest March 24th. I believe most of these are special calls assigned for the contest. None of them are in the 90 callbook. I would rather not QSL via the buro because these stations are probably not known to the buro anyway. The ones I still need are ED4VPM, FF1COM, FF1MKK, PB0AIU, TM6A and Y38I.

In article <CMM.0.88.642700952.geirha@hornet.uio.no>, geirha@hornet.uio.no (Geir Egil Hauge) writes:

> I have heard something about a new antenna called Crossed Field Antenna.
> This antenna is said to be as good as ordinary antennas, but is very
> small in size, and can be placed in the desk, at a window. Is there
> anybody out there, who has tried this kind of antenna?
>
> -geh

The Cross-Field Field antenna is purported to be capable of directly synthesizing the Poynting Vector. I don't have my copies of the info at hand but the relivant articles may be found in:

"Electronics and Wireless World" March 1989, Nov 1989 and March 1990.
a "flame" letter may also be found in the July 1989 issue of same magazine.

EWW is a British publication and might be found in some of the large public libraries, particularly those with technical emphasis. Some university libraries may also carry it. BTW, if any one can come up with a copy of the March 1989 article I would appreciate a copy, our library here at work lost that issue.

Schematicly the thing looks like:

```
 _______
 |     |
 |     |
 |     |      < - a cylinder
 |     |
 |     |
 |     |
 |-----|<------   feed point A

---------   <-  a torroidal disk  feed point B

_________   <-  another torroidal disk  feed point C

 -------<------   feed point D
 |     |
 |     |
 |     |    < - another cylinder
 |     |
 |     |
 |     |
              |-----|
```

The overall height is about 0.7m, cyliners are hollow and about 0.1m in diameter. The torroidal disks are about 0.15m outer diameter and 0.08m inner diameter. I don't know the spacing off hand but a good guess would be about 0.025m. The author split the drive with a phasing network and then used 300ohm twin-lead to feed the antenna. Points B and C are fed by one of the twin-lead feeds (on the inner edge of the torruses (torri?) and points A and D are fed from the other twin-lead. The feed lines come up through the lower cylinder.

That's all I have on the thing from my memory. It looks interesting as an object-d'art as well as a neat summer project. The author claims good results on 40 and 20 meters, possibly as good as his dipole. What we need is some one to put the thing through MININEC and then let's play around with it. It may be as good as the AEA loop.

Has anyone tried using surplus CATV hardline for things like the Army Loop or an home-brew version of the AEA loop?? That might be some neat material for things like that.

Ron Todd,   K3FR   the PATHFINDER guy

Can MININEC really analyse aerials of arbitrary geometry? I thought
it was only good for line antennas and arrays of line antennas. I
believe you may have to go to the original NEC to get the capabilities
of analysing the CFA. I have been waiting to get some free time to
analyse the CFA by first principles (using a computer to do the
numerical integration, of course -- I am not *that* masochistic,
just barely masochistic enough to try modelling the CFA; maybe :-).

>"Electronics and Wireless World" March 1989, Nov 1989 and March 1990.
>a "flame" letter may also be found in the July 1989 issue of same magazine.

The author of the November '89 article is also selling a kit of the
CFA in G-land. Anyone on the other side of the pond tried it?

```

>              |     |
>              |     |
>              |     |
>              |-----|
```

An interesting variant (pretty obvious, but also written up somewhere, I forgot where I read it now) of the above is to cut the above diagram at the halfway point and installing a perfect ground plane there to get the mirror of the bottom half. Another variant that occured to me is to replace the "D-plates" by a slotted loop in this ground plane. If you go through the field equations, you can see that the H-field generated by the slotted loop is orthogonal to the E-field generated from the stubby E-cylinder, satisfying the Poynting-vector junkies :-).

I wonder if there is anyone *seriously* experimenting with the CFA who could report trustworthy real-world results to the net?

(Ron: send me a FAX number or a snail-mail address. I have the CFA article you are missing.)

How much $ does it cost to get a ham-radio license?
Do I need to pay to take a test?
Where can I take the test?

The above questions sound silly, but I am learning morse code and planning to take the test soon.

I would like to contact (via e-mail or postal mail) other VLF/LF radio enthusiasts. This includes those interested in any aspect of VLF/LF radio, including wave propagation, homebrew receiver construction, etc.

Please respond via e-mail if possible.

This is a corrected posting. My first posting included an incorrect phone number and Internet address. My apologies.

The response to my query about posting the VOA broadcast schedule was overwhelming. Dan Ferguson, in VOA Engineering, has agreed to compile the information and post it in rec.radio.shortwave. Look for it in the next few days. In addition, I am going to suggest to Dan that he repost the schedule quarterly.

For those who asked specific questions, I'll try to answer by e-mail or refer your questions to the proper people.

Thanks again for your input.

73 es good dxing.

I recently received some mail from N4HGF (Warren Tucker) which I tried to reply to. The reply address was wht@n4hgf.gatech.edu. Unfortunately the mail bounced with an error I frequently get from the host gatech.edu. I'd appreciated getting a better contact to N4HGF to thank him for the data he sent to me, and to ask him to see if he can get some pressure put in the gatech.edu mail sysadmin to clean up their act with respect to the mail routing there. It seems that it is routing the mail TO ITSELF!

Regarding the differences in audio, and frequency ranges between the FT-470 and IC-24:

Audio - The FT-470 has relatively low audio level. Impossible to hear very well in a noisy car. The IC-24 has a louder amplifier and I feel it is acceptable.

Freq Range - Both radios have expanded VHF coverage (138-174). The IC-24 is easily modifiable to expand the UHF range as well. Believe it or not, following the modification, you will also enable the 800 MHz range. Also, it is possible to expand the VHF range to include the aircraft band (118-138 MHz). The radio includes a built-in am demodulator which automatically switches in/out depending upon the appropriate frequency. How 'bout them apples?

Mike, I guess I don't understand your point either. I find I must agree with Scott. Priority scan rates of several seconds is a worthless feature in a scanner. Any manufacturers listening?

I've got a whole buuuunch of Teletype Model 43 KSR terminals, some with RS-232, some with built-in 300 baud modems. They're all in good shape, service pulls, known working. Great for any low-speed printing application, transaction recording, SMDR printing, what have you.

I'll throw in two ribbons (black, unused) per TTY, too. You can buy 'em for (no lie!) $15 each, or $25 a pair, F.O.B. Pasadena CA, plus UPS COD shipping (at our cost, straight off the UPS chart). If you're interested, please contact:

Workman & Associates
1925 East Mountain Street
Pasadena, CA 91104
818-791-7979
fax:794-2297
bbs:791-1013 8N1 24/12/3

Catch? None! I have quite a few more than I need, and would like to find good homes for them. Heck, at this price you can use them for targets!

If you'd like a quantity, call and we'll wrangle.

Alex

>designed receivers and are subject to intermod and spurious reception.

Geez! I wish people (like you) would be just a little more conservative
in their remarks concerning other manufacturers equipment, especially
when you admit that you have never owned a Yaesu!

I won't comment on all of the HT's available on the market, however, I
would like to say that I am ESPECIALLY pleased with my Yaesu FT-470 dual
band HT.

This rig has everything! built in no less without ANY additional expense.
It is nearly as small as the ICOM IC-24 (appearances can be decieving),
has built in encode/decode, crossband repeat and extended vhf recieve
without modification. The list of features goes on and on. Yaesu did
have a problem with intermod on early versions of the rig, but that has
been fixed and they are upgrading older units.

The best part is the radio is commonly available for less than $400.

Now if I could only find a mobile rig that does all that the 470 does..
sorry folks... it isn't available, not even from Yaesu (dumbies!).

Two other points, the intermod problem that all manufacturers are
suffering are due in large part to the demand by Amatuers for extended
recieve on their HT's. If you open up the front end to allow extended
recieve your bound to suffer intermod to some degree or another.

Final point.... all of my vhf/uhf gear has historically been ICOM, but
you can't beat the 470 for all around performance AND price. ICOM's
nearest is the IC-24 at $570+, and then you still have to buy extras.

Heck... I liked it so much I bought two!

+I have heard an interesting "numbers station" over the past 4 months or so
+and was wondering if anyone out on the NET might have any leads as to its
+location.
+here in Boston. IT ALMOST OVERLOADS MY RECIEVER WITH THE ANTENNA UNATTACHED!
+This station is not coming from Cuba, but most likely from someplace in the
+New England area.
+Another thing that caught my attention a few days ago, was that the announcer,
+who seemed not to have an accent, does have one. She has a Boston accent, one
+I didn't notice because I am so used to it.
+If anyone has ideas, or has heard this station from other locations, please

In short OM, *NO SHIT*?!!:-) Several of us here in So.Cal traced one like this to a "fenced-off" area in the local foothills. The place was a little brick building, with a sloped roof and a heavy-duty looking generator on a small trailer. There was a trailer-mounted vertical antenna and it seemed to be connected to the building with some LARGE size coax (like about 3" dia!) and a few cables...the door was a metal-with-rivets affair. No insignias on the door, a few olive jeeps and a black Ford 4-door-staff car were parked nearby. Outside the fence, we were greeted by a regular-Army Sargent with a nasty looking M16 and told to "go away, and forget you ever saw this place...the whole area is ours...deadly force, next time, bla-blah, NOW BEAT IT!" Uhuh, right Uncle...take it easy, eh? ;-) They escorted our vehicles out of the canyon!

We traced another one to downtown L.A. on Spring Street, that's where the local FBI/CIA offices are...soooo..try looking in the phonebook and start your DFing wherever the local spys 'n' spooks hangout. When you find it, be circumspect, be polite, they have no sense of humor whatsoever and might just shoot or bag you for kicks.

Officially the government has no-comment on these stations but the fact is the US intelligence community uses number stations (just like all the rest!) to orchestrate their covert operations. Once discovered, they tend to move or disappear. The point being: Don't fuck with these people, they'll make your life miserable if you annoy them! Ordinary citizens disappear every day and no one will blame the government if you suddenly don't show up to work/school/etc....be careful!

I have a friend in Paupau New Guinea with whom I would like to communicate with using packet radio. We both have HF rigs and will be getting TNCs eventually.

I was planning to use 10 meter HF, but understand only ASCII data can be transmitted. Is this correct?

I know that binary data could be converted to ASCII, transmitted,
and then converted back. Would this be considered legal, or not?

Does anyone know any networks that work that part of the world,
that would allow me to go through them rather than attempting
a direct link.

Is there a VHF or UHF network link between here(Dallas) and there?

Thanks

John H. Anderson, N5OPY

Could you describe how I should go about probing for this point, and how
do you know when you find it?   I'm interested to find out if I can do
this with just a simple SWR meter after I've done my trimming, or do I
need some other equipment?

Thanks in advance,
Dube Todd

I am interested in knowing if there is any Amateur organiation that is working on increasing the number of countries that have 3rd party agreements with the US.

If there isn't, I think US amateurs should start such an endeavor. Why is the list so small?

We have used an old army GRC-10 field transceiver as a coffee table in our apartment for about two years. It is three separate units mounted on a large base that was meant to be bolted to a jeep. It weighs almost 200 pounds, and we are thinking of using it to hold up my car today while I do my own brake drum re-turn with sand paper, using the rear axle as a lathe!

It's a beauty of a boat anchor, but it has its uses!!

Yes, we are college students (and especially Texas Aggies!)

> To: info-hams-incoming
> Subj: License Fee?

> How much $ does it cost to get a ham-radio license?

The administrative fees for the exams would be as little as $4.95 if you took and passed all the tests you ever planned to take in one sitting.

If you fail a test, you are charged the administrative fee again when you return to retake the test (even if it were the same day at the same place!)

> Do I need to pay to take a test?

Not for the NOVICE. All you need for the NOVICE exam is two GENERAL CLASS or HIGHER volunteers who are at least 18 years of age and not related to you. They are responsible for all the paperwork and scheduling.

TECHNICIAN, GENERAL, ADVANCED, and EXTRA all are administered under the VOLUNTEER EXAMINER (VE) system, and an administrative charge (currently $4.95) per sitting is required. A VE Session is held by accredited Volunteer Examiners (usually associated with a radio club or event). Three VEs must be present and none of them may be related to you.

By the way, you can take the NOVICE at a VE session, too.

> Where can I take the test?
>

VE sessions are held periodically in many cities. If you are not near a town where regular sessions are held, look for a hamfest you can go to. Tests are given at many hamfests under the VE system.

If you know any local clubs or hams, ask them. If there is an electronics store nearby (especially one that carries ham radio equipment!) they will have test schedules posted. A college or universities may have a radio club, and Community Colleges or Vocational Centers sometimes even have classes and host testing sessions.

If you can't find anything obvious, call or write the American Radio Relay League, 225 Main Street, Newington Connecticut 06111, (203) 666-1544.

(We had a guy do that here in Dallas, and they gave him our club's address. Another member and I dropped by his house one evening after work and gave him the NOVICE code and written exams. He passed, and is now KB5MIJ!!)

Or, if all else fails, Email or call me; I can check some other sources for your area.

CHECK WITH YOUR LOCAL VE TEAM REGARDING PREPARATIONS FOR THE EXAM! YOU MAY BE ASKED TO BRING YOUR OWN PENCILS, SCRATCH PAPER, BLACK OR BLUE PEN FOR SIGNING FORMS, AND CALCULATOR.

PLAN TO BRING SUFFICIENT IDENTIFICATION (DRIVER'S LICENSE WITH PHOTO IS GOOD!) SOME VE TEAMS REQUIRE *-TWO-* FORMS OF ID!

IF YOU HAVE ANY LICENSE OR CERTIFICATE THAT PROVES YOU HAVE CREDIT FOR EXAM ELEMENTS YOU SHOULD BRING *-BOTH-* THE ORIGINAL AND A PHOTOCOPY SINCE A COPY WILL NEED TO BE FILED WITH YOUR APPLICATION.

YOU ARE NORMALLY GIVEN ALL THE TIME YOU NEED TO FINISH THE EXAM. PLAN YOUR TIME ACCORDINGLY. ARRIVE ON TIME OR A LITTLE EARLY.

> The above questions sound silly, but I am learning morse code and planning
> to take the test soon.
>

No, they don't sound silly. Everyone has to learn somehow, and this is a good place to ask.

GOOD LUCK!

I would have trouble with this: given the regularity of the traffic,
I think you'd be able to intercept enough to break a simple substitution.
>
> >Hence all of this simplicity is fairly secure and doesn't require
> >a lot of expensive (and vulnerable to capture) crypto equipment.

This would tend toward the 'low-grade' or easy to break cipher point
of view.

>
>    This is true so long as the receiving party doesn't need the

> break any speed records.
>
>    My theory is that the numbers stations ARE in fact the key
> to some cipher that is transmitted via a different medium...

Well I doubt this. If you put the key out there in plaintext for all
to catch, then you have really compromised the cipher, and all the
opponent needs to do is intercept the traffic.

Here is what I heard from a friend who travels regularly to Japan
and has contacts with Icom in Japan.

The radio, as currently designed, is capable of receiving the
cellular phone band. Since it is illegal to intercept cellular
phone, Icom is having difficulty getting FCC type acceptance and
importing the radios. Therefore, Icom has decided to pull the
current radio, and come out with a slightly modified version
which does not receive cellular phone. I think you will see
this radio back on the market in modified form very shortly.
I also suspect that enterprising hams will find a way to
"remodify" the radio back to its original form.

By the way, my friend picked one up last month in Tokyo and he
really loves it. Don't worry. Icom has no problems with the
radio or its production. You will be able to buy one real soon
now.

Sorry - I forgot to include ELNEC in my summary. Anyway, I don't know whether to put it in tinker or modeling as I don't have enough info on it. I'd reccomend getting more info from the authors before you drop the $$ on the pricey packages just to be sure you know what you're getting and what you're not getting. Remember, your mileage may vary.

Since WWV doesn't transmit near any of the old ham bands (80,40,20,15,10), no ham reciever I have ever owned can pick up WWV. I think this is pretty typical of pre PLL receivers. In light of that trend, how can you say that WWV information is most basic?

Regarding the exam process, I think the idea of a small fixed question pool is more of a problem than whether WWV is covered in the pool.

I have some questions regarding DOVE-Oscar-17.

1. Has the beacon on 145.825 been turned back on yet? If not, when?
   I think I hear a weak signal at times that correspond approximately
   to DOVE's period, but not to my orbit predictions (see #3).

2. When DOVE-1 starts transmitting voice, will it be on 145.825 FM,
   or on some other frequency?

3. How long are orbital elements good for and where can I get updates
   when the ones I have get old? I know they are occasionally posted
   to the net. The ones I have don't work, or it might be that the
   beacon is just turned off.

4. How do I capture the DOVE telemetry data? (I realize that this
   was discussed a while back, but I didn't have my PK-232 then! :-)

Thank you for your help,

Ross - N6SJD

>........                                      ^^^^^^^^^^^^^
```

The use of emotive words like "eavesdroppers" to try to sway arguments is
called innuendo, the neutral word would be "listeners".   Listening to
cellular telephone conversations may be _illegal_ in the US, but radio
waves have a history of not respecting national boundaries. The question
of whether it is morally wrong to take radio transmissions that are not
intended for your reception is, in my opinion, moot.   However cellular
transmissions are a special case only inasmuch as there are large and
powerful vested interests. A problem with all telephone systems is that
the users have been systematically lied to about how much privacy they
have.

```
>
>The beginning of the end of this is near however. The analog RF
>transmission will soon begin to be replaced by digital RF transmission... .
>. . . . . . . While I wouldnt say that it would be impossible to
>decode this, those thinking of it will be sumpremely challenged: One
>RF radio channel will have several digital voice channels
>multiplexed onto it and will be encoded using some pretty high-speed
>digital signal processors.
>
```

Unless of course experimenters acquire commercial equipment and modify
it. Radio experimenters have something of tradition of doing just this.

If cellular radio really will be secure against unathorized reception,
then surely there should be no law against such reception, after all
we don't have laws against teleportation or telepathy do we?

```

Here are the answers to the question I posed a few days ago. Kevin mailed the answers so, I'll just use his posting and add a litle more explaination.

>From: "Kevin B. Kenny [the Arch-Traitor] KE9TV" <kenny@cs.uiuc.edu>
>
>>Anybody out there know what the community now calls these measures?
>>cps, kmc, mickey-mikes.
>
>Hertz, `gigs' (GHz), and `puffs' (pF), respectively.

cps is cycles per second, which we now know as Hertz.
kmc is kilo-mega-cycles, which we now know as giga-Hertz.
mickey-mikes is for micro-micro-farads, micro-micro is now referred to as pico or puffs and is usually used when referring to capacitor Farad values.

regards, Dave

Mike Edelman (KE8YY) inquires:

>I was looking at an ad for the new AEA antenna ad in AES's ...
>another variant on the small capacitively tuned loop idea ...
>Has anyone played with this thing yet, or perhaps with other variants
>on the same idea..?

To shorten an antenna, you have to load it. However, most of the RF gets eaten up by the coils. So you start taking off as many turns on the coil as you can. But you have to offset the L component with a C component. So you have a big capacitor at the end. Which gives you very narrow bandwidth.

I have not used the AEA loop (looks like a football stadium portable seat to me), but a friend calculated that the bandwidth should be in the range of 10 to 20 kHz with around 80% efficiency - that is, you sacrifice bandwidth for the sake of RF.

Magazines related to ham radio from Ulrich's International Periodicals Directory 1988-89 edition. Comments on the content or value of any of these from those who have seen them would be appreciated. I might have missed some of the foreign language ones since it didn't always give a hint as to the subject matter. Also, the US magazine "Ham Radio" was not included in their list. I don't know what the criteria was for inclusion in their listing. If you notice an omission, please send me the relevant info, so I can maintain the list. Enjoy.

I would also like to see an FTP site for Amateur related news items.
Especially for the electronic versions of the ARRL Newsletter, GateWay,
QEX Experimenters Exchange, and maybe even the W5YI Electronic Version
from Compu$erve(??).

I know of an FTP site named 'hamster', but I don't know if they have the
latest bulletins. Also, 'k9iu.bacs.indiana.edu' seems to have SOME of the
ARRL Newsletters and Gateways, but not always the most recent ones.

(The reason I'm interested is for extracting useful articles for our club newsletter, so I don't have to key them in manually. :-) If someone gets them regularly and we be so kind as to mail them to me, I'd also be very interested.)

I am considering a Sony 2010, but have a couple of questions that are unanswered by the reviews I have read here and in Passport.

1) What are the dimensions? I can just guess that the thickness is slightly larger than a D cell diameter.

2) With SSB and CW, there is no carrier for the synchronous detector to lock on to.. Does it just act like a normal BFO for these signals?

3) Would it be suitable as a ham reciever for field use or at home, maybe with a homebrew qrp tranmitter. I guess I would just turn it off during transmit if there is no "standby" mode.

Thanks,

Don Perley

I used to have the call WA6SIE. Very nice for CW (at least the suffix).
Unfortunately, the entire time I had the call I lived in apartments with
no HF gear or antennae, so I never used it on CW.

I started getting interested in ham radio with an old Hallicrafters SX-111
receiver. It had WWV builtin with a 100 khz calibrator that I could use
as well.

> "remodify" the radio back to its original form.

If the FCC is refusing type-acceptance just because it is capable
of receiving frequencies that happen to also be used for cellular
services, then we need to know about this, and immediately. There
is no authority I know of for the FCC to refuse the type acceptance
on such grounds since the ECPA does not outlaw the ownership, sale,
or import of such devices. There *IS* legitimate use for hams to

receive signals on such frequencies without receiving cellular.
If you don't know what I mean, get out your interference handbook
and reread it.

If Icom is having this problem, then we need to find out from them
just who at the FCC is their contact, or who it is that has ordered
the type-acceptance refusal, and do something about it. But we need
to get this info (or the truth, whatever it really is) from Icom.
I plan to call Icom as soon as I find the phone numbers again and
talk to them about it. I certainly won't accept the silly "production
delays" answers since my question will be one for their lawyers instead
of their marketers. Perhaps I should ask for their legal office right
at the first answer.

> By the way, my friend picked one up last month in Tokyo and he
> really loves it. Don't worry. Icom has no problems with the
> radio or its production. You will be able to buy one real soon
> now.

Well, since we know this, we certainly know the "production delay"
problem is more than just a delay. It certainly is one of these
various possible cases. I just hate to see us get shafted with
a lesser useful radio because of Icom-America buckling under some
sort of uncalled for pressure from the FCC or the cellular industry.

WE NEED TO GENERATE SOME COUNTER PRESSURE!

Charlie (KX7L) asks:

> On 15m CW last night, I worked a bizzare one:
>   8J90XPO

>Anyone know anything about it?

Intimately. You got the call right; there's a big controversy among JA hams about the "90" in the callsign. Packet people don't like the numbers of characters. Purists argue that there is no call district 90 and insist on the /JA3 suffix.

8J90XPO, or, according to nit-pickers, 8J90XPO/JA3, is the "Osaka Hana no Banpaku Kinenkyoku" ("Osaka Flower Festival Special Events Station"). As all other special events stations, it is sponsored by JARL, and is open for use by JARL members (a rule I hate). The Flower Festival itself has been a fair success; you have gardens both indoors and outdoors, with hothouses for tropical plants and air-conditioned rooms for Arctic flora. The Japanese have always been passionate about flowers, and this time, people are queueing for several hours just to see flowers! And they pay for it, too.

8J calls are being assigned, by convention, to special events stations. Other 8J calls include 8J1XPO, 8J1YES, and so on.

Incidentally, 7J calls (which also belong to Japan - Japan has JA thru JS, 7J thru 7N, and 8J thru 8N) are assigned to recriprocal calls. Unfortunately, recriprocal licenses are terribly expensive in Japan (9,000 yen, or roughly 60 dollars). I hate this, and have argued against it, but have been ignored so far. (I'm Japanese, so I can't get a recripocal anyway, but I don't think it's polite to have your guests pay for a hobby that you share.)

Gee, and all I had was a $20 SWR meter to trim the J, and an hour to
kill probing for the 50 ohm point.

Contrary to popular belief, HP engineers don't use a $50,000 instrument
to build a $5 circuit.... Unless it just happens to be on the shelf. :-)

Someone wrote asking about an old crystal grinding article. (I missed the original article while at MTT-S).

There is indeed a computerized way of finding old Ham related articles.
It is a program supplied by: didah publishing
P.O. Box 7368
Nashua, NH. 03060

I just ran the copy I bought at Dayton, and got a list of some 390 or so articles related to "crystal".   The ones following looked like they might relate to the original question of grinding or shaving freq:

QST jul '52 p68
QST jun '49 p120
CQ   oct '49 p36
QST apr '30 p41
73   jul '68 p50
CQ   jul '45 p16
QST aug '56 p65
QST apr '53 p51
QST jul '53 p48
QST mar '53 p138

I used my own guess from the listed titles to choose these, so for better completeness , run your own copy of the program. (runs on a PC.)

Unlike the other HP responses, I have had great success with Kenwood HT products. I've had a TR2600A for 3+ years that I've just retired to be my packet radio transceiver. To upgrade, I purchased a new Kenwood TH-26AT last month, which I like alot.

The problem with trying to find a reasonably priced used HT with all the feature sets you are after is that they are all getting grabbed up quickly by folks looking for portable packet radios. Unless you've got a good swap source, you'll be trying to buy in a seller's market and the $'s you spend won't be reasonable.

My advice, would be to buy new. 1) you get all the features you want now, 2) you get the manufacturer's warranty, and 3) you can incrementally add on options within the lifetime of the product. This last point is important in that the radio model probably won't go obsolete too quickly.

If you want to try grinding a crystal, i suggest you try Jewellers Rouge as the abrasive. This is much finer than household scouring powder (AJAX) and although it takes a lot longer to grind, you are less likely to lose the crystal activity (activity loss is, in part, due to the unevenness of the ground surface as a result of the harsh abrasives).
Rouge is used for polishing some types of lens; you can get an optically good surface if you are careful.

And i thought 'kitchen table engineering' was a thing of the past...!

> PS anybody have some more info on these low power TV stations ?
>

I have some more info on these low-power UHF TV stations. Licenses are being applied for and granted, rapidly, as the new FCC rules take effect. Here in Rochester, we now have two such transmitters- W15AL on channel 15, and as mentioned, W38AW on channel 38. More are in the plans for this area within the year. They are basically allowed to run any type of programming they choose, except they cannot run any of the major network stuff, and they are not to be picked up by local cable operators. W15AL transmits music videos 24 hours a day, and you can call a 900 number to request a video- they put a menu up periodically with the codes for the selections. They charge $2.50 a call, and that's how the station is supported. They are apparently tied in to something called "The Jukebox Network", a loosely formed group of these broadcasters based in Miami (I think). They are limited to 1 kW and the expected range is 8-10 miles, but W38AW seems to do better than W15AL- I get a MUCH better picture from their test pattern than I do W15AL's video, both transmitters are (to the best of my knowledge) located on Pinnacle Hill with all the other TV transmitters in Rochester.

These stations are one of the reasons the FCC mandated that cable operators supply customers with an A-B switch so the customer could get live stuff off the antenna if he wanted it.

I hadn't heard that they were only supposed to operate on a non-interference basis. Seems like that would be a problem, since these stations are money-making entities and as such, are not likely to "turn the transmitter off" because of an interference problem. I think the power limit is the factor which will limit interference, since the range is so short.

BTW,last time I checked, W38AW was still only putting out a test pattern. I understand they should go live any time with old reruns or something.

* STS-35 NEWS *

===============

The launch of STS-35 has been delayed at least until 31-May-90 due to a Shuttle hardware problem.

Here is the expected operating schedule for unattended SAREX operations by Ron Parise (WA4SIR):

Mission Elapsed Time
(D/HH:MM)

Start		End
0/22:00	-	1/10:20
1/21:15	-	2/08:35
2/20:00	-	3/07:55
3/19:00	-	4/06:40
4/18:30	-	5/05:45
5/17:20	-	6/05:50
6/17:40	-	7/05:35
7/17:45	-	8/04:45

Listed below are the frequencies presently intended to be used by SAREX for both packet and voice. Note, that in no case is "simplex" operation indicated. DO NOT CALL WA4SIR ON THE SAME FREQUENCY YOU HEAR HIM!!

	Shuttle Transmit Freq.	Accompanying Shuttle Receive Freqs.	Offset Designation
Group 1	145.55 MHz	144.95 MHz	Primary
	145.55 MHz	144.91 MHz	Secondary No. 1
	145.55 MHz	144.97 MHz	Secondary No. 2
Group 2	145.51 MHz	144.91 MHz	Primary
	145.51 MHz	144.93 MHz	Secondary No. 1
	145.51 MHz	144.99 MHz	Secondary No. 2
Group 3	145.59 MHz	144.99 MHz	Primary
	145.59 MHz	144.95 MHz	Secondary No. 1
Group 4	145.55 MHz	144.95 MHz	Primary
	145.55 MHz	144.70 MHz	Secondary No. 1
	145.55 MHz	144.75 MHz	Secondary No. 2
	145.55 MHz	144.80 MHz	Secondary No. 3
	145.55 MHz	144.85 MHz	Secondary No. 4

The 145.55/144.95 combination is in both Groups 1 and 4 because alternate uplink frequencies from Group 1 would be used over North and South America while those from Group 4 would generally be used in other parts of the world, such as Europe and Africa.

Dissemination of Shuttle information to those participating in SAREX, as well as all interested amateurs will be via a system of key stations, particularly

WA3NAN, at Goddard in Greenbelt, MD, W5RRR, at the Johnson Space Center in Houston, and W6VIO at the Jet Propulsion Lab, in Pasadena, California. These stations, and others, will operate on HF and VHF 24 hours a day carrying official NASA supplied voice communication between Mission Control in Houston and the Shuttle crew. To further provide information specific to SAREX communication opportunities and related information, bulletins originated by amateurs stationed at the Johnson Space Center will be fed via a computer network to these stations and others including W1AW. The SAREX Metabeacon may also be used for announcements. It is planned the frequencies listed below will be used for this service. The selection of frequencies will be made depending on HF propagation conditions during the mission.

Station	Approx. QTH	Nominal Frequencies in MHz (+/- QRM)
WA3NAN	Wash. DC	3.860, 7.185, 14.295, 21.395, 28.650. 147.45 (FM)
W5RRR	Houston	3.850, 7.227, 14.280, 21.350, 28.495, 146.64 (FM)
W6VIO	L.A.	3.840, 21.280, 224.04 (FM)
W6FXN	L.A.	145.46 (FM)

All are SSB using the sideband normally used on the band unless otherwise noted.

I've often seen messages on this net which have been reproduced from packet sources. I'm wondering if there is either 1. a gateway packet machine which allows someone like me to send e-mail to a packet site or 2. someone on the east coast of the USA who is interested in performing that function.

Reason: my uncle in the Shanandoah valley of Virginia is getting into packet radio and will soon be on packet e-mail. However, I don't have enough time to add packet radio as Yet Another Hobby to my list (sorry guys). But I'd still like to be able to communicate with him electronically since it is e-mail in both places and internet networking is on my Officially Recognized Hobbies list.

Thanks for any help,

- tom

What about the Icom R-7000? As far as I know, this receiver easily receives
all of the cellular band, and you can buy it at any participating
amateur radio store (25MHz to 2GHz coverage). Maybe the R-7000 received
type acceptance before the ECPA passed Congress? Do you need FCC type
acceptance on receiving devices before you may sell them in the United States?

The patent conflict seems more likely.

First of all, I would like to know how frequencies are assisgned to various
radio stations. Because on most of the frequencies, lot of stations
will be relaying at the same time causing lot of distortion/interference.
With this which ever station is stronger or closer will take over leaving
no scope for weaker stations. If there is any governing body they
should not assign same freq. to more than one station who start at the
same time.

Secondly, one station is relaying on 15120 and 9610 khz at a particular
time.(that country's home services). How difficult is it if they want
to extend the same transmission to 11620 khz besides 15120 and 9610 at
the same time. (Assuming they have more than one transmitter).

]
]If the FCC is refusing type-acceptance just because it is capable

]of receiving frequencies that happen to also be used for cellular
]services, then we need to know about this, and immediately. There
]is no authority I know of for the FCC to refuse the type acceptance
]on such grounds since the ECPA does not outlaw the ownership, sale,
]or import of such devices. There *IS* legitimate use for hams to
]receive signals on such frequencies without receiving cellular.
]If you don't know what I mean, get out your interference handbook
]and reread it.

While I agree with Phil's concerns, I suspect that they are misplaced.

I think the R-1 hangup is patent related. Uniden, having acquired ALL domestic makers of scanners, now owns a lot of scanner patents, and apparently is starting to enforce them against other scanner makers. For example, selective scan delay and front end track tuning are patents held by Uniden. i.e. - if you want to buy a good scanner, it will have to be either made by or licensed by Uniden. I don't know what other patents they may hold.

I personally think this is a crock - both of those techniques are obvious, and one requirement to uphold a patent is that it be non-obvious! However, I don't know of any scanner manufacturers fighting the patent. Hmm.... I built a working scanner in 1965, which was more than 17 years ago and thus clearly predates any scanner patents still in force... should have patented it (however, it didn't have either selective scan delay or track tuning)!

]WE NEED TO GENERATE SOME COUNTER PRESSURE!
]

Only if we find the FCC is really at fault, and this this is not just an urban rumor.

From the RISKS digest:

Date: 5 May 90 02:34:32 GMT
>From: chuq@Apple.COM (The Bounty Hunter)
Subject: So many weapons, so little radio spectrum

>From the May, 1990 issue of Monitoring Times, Page 4:

Electronic Blizzard Brings Down U.S. Planes

The Scene is Libya, 1986. High in the sky, an armada of 33 high-tech U.S. fighter planes begin their attack. But something is wrong. One plane, carrying two crew members, crashes. Of the surviving 32 planes -- including five F-11's -- seven are unable to get off even a single shot. The probably reason: an electronic blizard that, according to Pentagon officials, came not from the Libyans but from high-powered U.S. military transmitters that filled the night sky with electronic signals designed to jam Libya's anti-aircraft defenses, hunt down targets, guide weapons and communicate.

According to Air Force Colonel Charles Quisenberry, during the Libran strike, U.S. weapons "were interfering with each other." Numerous U.S. weapons, some of which were electronically guided, went astray during the attack, damaging three foreign embassies and diplomatic residences, uncluding those of France and Japan.

Further, says Quisenberry, some of this interference can "actually effect the ... aircraft's flight controls as well as its fuel controls," either putting a plan into an uncontrolled turn or dive or turning off its fuel supply.

The Pentagon recently finished a classified seven-month investigation of the prolem which led officials to order a more detailed three-year probe. Preliminary studies of one war plan shows "thousands of [frequency] conflics" among weapons. Says Quisenberry, "There are major, major problems out there..."

Radio devices do need part 15 certification to be sold or imported into the United States.

This certification says NOTHING about what the radio's capabilities or authorized uses are; it is strictly dealing with the radio's (in)ability to interfere with other radios.

There is no authority in the ECPA that prevents the sale of devices capable of receiving the frequencies the cellular service uses. If the FCC is denying part 15 certification because a receiver is able to receive the cellular frequencies (825-845 and 870-890) then it is my opinion the FCC is acting illegally.

There is another possible cause for retrograding the radio to delete those frequencies. The cellular industry might have threatened Icom with a law suit, which we know will costs lots of money even though Icom would win. The extremely sad state of legal affairs in this country makes it possible to manipulate business this way. I don't know that this has happened, but if it has, then I would like to see the hams form an organization that can do its own form of legal threatening.

Of course there still exists the possibility that a patent conflict exists for a patent whose owner failed to obtain protection overseas. An owner who makes demands at such a level as to force someone to go back and redesign their invention out of the device has done poorly in making sure of his own profits.

The rumors on this will go on for a while. When the radio does ship in the US, its features or lack thereof will tell some of the story. If the cellular frequencies are removed, then I personally would urge that the radio be boycotted as a form of counter pressure to the manufacturers to convince them that buckling under to pressure from other sources is not to be taken trivially. There is no valid reason to delete any frequency range in the receiver.

> The use of emotive words like "eavesdroppers" to try to sway arguments is called innuendo, the neutral word would be "listeners".   Listening to cellular telephone conversations may be _illegal_ in the US, but radio waves have a history of not respecting national boundaries. The question of whether it is morally wrong to take radio transmissions that are not intended for your reception is, in my opinion, moot.   However cellular transmissions are a special case only inasmuch as there are large and powerful vested interests. A problem with all telephone systems is that the users have been systematically lied to about how much privacy they have.

I believe we really SHOULD do something about this. One simple way is to simply spread the word around to everyone you know that cellular telephone conversations have a somewhat better expectation of privacy than cordless phones, but definitely not infinitely so.

Why cellular communications have some increased expectation of privacy:

1. There are 666 channels to scan through instead of 10.
2. There are fewer radios that can scan 800 Mhz, and they are a bit more expensive on average, but they exist and are in common use.
3. It is illegal to listen to cellular transmissions, no matter what frequency they are found on, but we know how much respect most people have for laws that prohibit what people do in their homes that cause no harm to anyone.
4. The voice channel on cellular uses exactly the same method of modulation as conventional two-way radios.

Why cellular communications are not completely secure:

1. Older TV sets with channels 70-83 still in them can receive cellular transmissions on channels 73-75 and 80-83. This fact should be taken with extreme concern by persons who are easily offended by strong language, especially if they have children.

2. Legitimate non-cellular uses exist for receivers that are capable of receiving the same frequencies as the cellular service uses.
3. Methods of making receivers that have cellular frequencies removed capable of receiving on cellular frequencies exist and are well known. Most units can be modified by adding or clipping some control diodes. Those that cannot, and for those not wanting to go inside, block converters exist that convert the 800 Mhz frequency block down to more conventional scanner frequencies.

I don't necessarily have all the reasons posted. If you come up with some others, you might want to post them.

My general advice to anyone considering the purchase of a cellular phone is to consider the communications on the phone to be open and public to people who for the most part you do not know. Unlike amateur radio, you can conduct business on the phone. Most hams don't worry about the privacy of their ham communications, and were business to be legal they would probably be ordering tons of pizza regularly. However with cellular, those who listen might try doing things nasty just because they think you have an expectation of privacy, like calling up the pizza place, citing the same phone number you just gave them, and changing your order. To prevent this, upon the initial order, tell the pizza place that ANY changes must be verified by calling you back since you are calling from a cellular phone.

Be sure you understand me; I am not saying cellular phones are bad; I am just trying to get the perspective straight. I am even considering buying a cellular telephone myself. One definite advantage of one of those portable cellular phones, if you get an AC power supply or a spare set of chargeable battery packs, is to avoid having to use that dreaded "call waiting" when you are using your home computer calling out on a modem. Just forward your phone to the cellular, or tell your cellular number to your friends, and go ahead and use the main phone line on the computer.

> If cellular radio really will be secure against unathorized reception,
> then surely there should be no law against such reception, after all
> we don't have laws against teleportation or telepathy do we?

Well, so far I have never met anyone who can teleport.

Hi.
I've finally been convinced that I should perhaps look into becoming a Ham radio operator. Where do I start? Addresses? Books? etc.

ALL INPUT APPRECIATED....please use e-mail

While it is not really a hamfest, on the second Saturday of each month, a rather large and *very* popular ham flea market is held at the Foothill Junior College in Los Altos Hills, CA. This is about 35 miles south of San Francisco. You get to it by taking Route 280 South from San Francisco to the El Monte Road exit. Talk in is on 145.27- which is a repeater local to the south bay/Mountain View area.

But Icom IC-28 line is worse than Yaesu 211 line in intermod and and selectivity. (I'm just talking about mobile units).
Icom 02AT line is good and rug.
Except for Yaesu bad reputation in costomer services, I don't see their design being inferior nor their durability. Why stay away?
I had a Kenwood 21AT for some years and it has no problem, but I understand it's layout is not very neat inside.
The current Kenwood HTs is lacking features (and size) to Icom and Yaesu.
But my Kenwood TH-215 has very sensitive and selective receiver, best I've seen yet.
All three brands are as good to me. Standard (Heath Kit) follows very close.
I noticed most people prefered Icom. why?
Kenwood wins out in looks too.
Icom wins in accessories compatibilities, and size in new ones.
Yaesu is still good in features (back lit keyboard in 470), and design.
My lost FT-23 was the best features/size at that time!

I want a 470 or 24AT later.

I am very much interested in having the VOA Broadcast Schedule posted
to the net. At the very least (if there in no sufficient interest)
have it available via some ftp site such as uunet.

About the frequency of posting it, if and when the schedule changes.
You can post the diffs, or post everything again. This depends on how
often the schedule changes and how much is changed. If the VOA
Magazine is published bimonthly, then lets have it bimonthly.

Scanning radios are not type-accepted. They are certified (See Title
47 part 15, and part 2 subpart J).   This is the same procedure that
personal computers go through. (The list include Verification, Notification,
Certification, Type Acceptance and Type Approval, and, boy, am I glad I'm
not a lawyer and have to read this sort of stuff all the time.)

Sounds like the R-1 puts out too much spurious stuff.

I don't get it......Icom already sells radios that make no attempt to restrict cellular coverage. No mods required. What is special about this one that would attract the FCC's interest? I thought the ECPA only prohibited selling devices that are SPECIFICALLY designed to intercept cellular phone calls.

Any ideas on this? Or did Icom's other radios come out before the ECPA, and then get grandfathered?

I always thought that the reason that Tandy restricted cellular coverage on their scanners was because of marketing considerations due to the fact that they also market cellular phones, not because of legal problems.

Can someone enlighten us on this?

The AEA antenna gets around the bandwidth problem by having a motor driven capacitor. At any one setting, the bandwidth may be narrow, but to change frequency you just nudge the remote cap control for minimum reflected power.

RTTY DX Notes, 1of3, 5/11/90

RTTY DX Notes for Weekending 11th May 1990.
Part 1 of 3.
BID: $RTDX1105

It seems to me that some DXpeditions go out well prepared, with good gear and good operators, while others do not. But speaking of dxpeditions, DX1 has heard of one that will be going to Lord Howe Island, signing VK9LI, for the A.N.A.R.T.S. Contest June 9th to 11th. The operation will be for three days prior to the contest and two or three days after the contest. This will be an RTTY only operation, and will not be running linears. As DX1 appears to know about it, you might as well send your QSL etc to him.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1ACB, JA1BLV, OD5NG, TG9VT, VK2EG, W1DA, W2JGR and the Tri-State DX Association VHF packet cluster. Your information is really appreciated.

RTTY DX Notes, 3of3, 5/11/90

RTTY DX Notes for Weekending 11th May 1990.
Part 3 of 3.
BID: $RTDX1305

QSL Information.

BY4AA will QSL via Box 085-205, Shanghai, Republic Of China.

T32AB says to send his cards to N7YL.

XW8KPL for some reason says to QSL to Box 310, Vientiane, Laos. (His home call is JA3MNP).

EO5O will receive his cards via Box 7 Chadyp-Lunga 27870, USSR.

EN8TJ will QSL via UT5JCF.

UC1TWR will QSL via Box 57, Grodno, 230003 Bylorussia, USSR.

Notes of Interest.

XW8KPL is active on 20 and 15 meters for a period of 1 to 2 weeks. After that stint they hope to operate from XZ (Burma) and S2

(Bangaladesh) with RTTY in both places. Though from reports from a reliable source, it is considered that RTTY would be impossible from both places. But we will wait and see what happens.

Conway Reef should appear from 17th to 29th May with six operators, though there is some doubt about RTTY.

Kuria Muria, A43KM/0 is expected about 17th to 24th May, again there is some doubt about RTTY.

Spratly has gone QRT, despite rumours to the contrary.

YV0AA cards should be available mid June.

Jan Mayen, JX9CAA reports that there are four operators there at the moment. JX2FL will operate SSB and CW from April until July, JX7XL and JX7DF will be there from April until October and will QSL via (call) N8013, Jan Mayen , Norway. While JX9CAA will be there from April until October and will be the only RTTY station operating and will QSL via LA5NM, he will be on RTTY on 14085 KHz and packet (at LA9FV) on 14109 KHz.

R3AVE, EO5O and the other odd Russian calls are special calls for the celebration of the end of WW2 with Germany.

Finally, don't forget the A.N.A.R.T.S. RTTY Contest June 9th 0000Z until June 11th 0000Z. See you there, and look for VK9LI. A report received says that JT0DX cards are being received in JA land. More hope.

GL DE DX1 (VK2SG).

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.

Someone once posted that they had schematics for a circuit that would descramble frequency-inverted audio. I would like to see these. If you know of such schematics and where I can get them, or perhaps you know the address the original poster gave to send an SASE, please let me know.

> Except for Yaesu bad reputation in costomer services, I don't see their design
> being inferior nor their durability. Why stay away?

They have a thin plastic feel to me. Also I've heard Yaesu has least frequency stability. The specs of a few rigs confirmed this.

> I noticed most people prefered Icom. why?

Icom's larger HT's have all used the same accessories including batteries. They have a wider battery choice and were first in second source batteries. Kenwood's current twist-on battery pack on the TH-215 and like are reputed to have breakable tabs.

> Kenwood wins out in looks too.

I cannot agree. I prefer the simplicity look of Icom.

> Icom wins in accessories compatibilities, and size in new ones.

So I guess you answered your question.

> Yaesu is still good in features (back lit keyboard in 470), and design.

Can you really read EVERYTHING on it in the dark?

> I want a 470 or 24AT later.

You are favoring the smaller size units?

The ECPA does not prohibit receiving specific frequencies; it prohibits receiving specific kinds of communications. The subtle difference here is very important. You can listen to your own harmonic of your own radio transmissions that happen to be in the same frequency band as cellular is assigned, but you may not legally listen to cellular communications even if you happen to catch it on an intermod or harmonic.

> know what other patents they may hold.

Could you post a description of what the various scanner features actually do and how they are operated? A lot of times, the "sales talk" description of these scanning features does not really say how they really work.

One thing I personally would like in a scanner is for SEPARATE timing controls on the time to stay while a signal is present and the time to stay after a signal goes absent. I have seen NO scanner that has this.

Another feature I'd like to see is to allow a single memory to define a block of frequencies in terms of the frequency step. When scanning hits this memory, it steps through all the defined frequencies and once done, goes on to the next memory. It would take but a few memories to program the complexity of the 2 meter band this way, not to mention the mess we call VHF land mobile.

Yet another feature is programmable lists, where scanning is performed via a programmable list of memories (including block ones from above). Thus I can set up several different scan groups which even have overlaps and pick the one I want quickly when I want it, rather than have to step through all the memories and set a SKIP on the ones I don't want.

> I personally think this is a crock - both of those techniques are

There are not enough frequencies. I believe most SWBC stations try to aim
their signals to only a small portion of the globe on any given frequency
or from any given antenna farm. You might be in a boundary between two of
the regions for some services.

> digital capable cellular phones).

Motorola has hired some RF engineers and located them in the same place
where cellular development is going on. The advertising for their jobs
stated "cellular" and "1600 Mhz". These were in some RF industry magazines.

> Of course, since all this is still in the R&D phase, it would not suprise me
> one bit if there are several different systems being developed by different
> companies......they decision to actually implement a system might not be made
> for several years yet.....

And therefore things are not in stone, yet. But certain companies are very
big sway at the FCC, and Motorola is mentioning availability of digital
cellular very soon. I am keeping watch on FCC developments via FR.

> BTW, some people get "antsy" about holding a portable cell phone near their
> head, and these transmit in the high 800 MHz region.....you can bet that these
> same people will be doubly antsy if 1.6 GHz cell phones become available!

That's where salesmen come in. Remember those guys? They are the ones that
have the public convinced that cellular is absolutely secure. They will
simply convince the public that cellular is absoluetly SAFE and make more
profit. Simple, eh?

> Even though I am not a ham, I feel for you fellows....having your spectrum
> stolen is bad enough, but then to be insulted by the Land Mobile industry so
> brazenly.......it is enough to make your blood boil.

They are just in it for the money. We know that.

This is posted for a friend without net access:

Hello Info-Hams folks,

I am looking for the value of two capacitors (C1 & C2) from the article "Need FM?" in the August 1989 issue of the magazine _73_. It is missing from my local library.

Thanks much in advance! - George

George Blahun   Quaker Hill, CT   KS1U

Folks may respond directly to me if you feel so inclined. Thanks - Gregg

I've heard a lot of talk about cellular radio, cellular phones,
monitoring this-and-that, etc. I would like to know if there
is somewhere a definitive technical tutorial on cellular
technology: past, present, and future... What is it, how does
it work, who are the players and what are they doing...???
I would appreciate any information very much.

Thanks,
Steve KF7WY

>................................

In the Mid fifties we (high school kids using 1 tube transmitters) used to grind FT-243 xtals up to the 40 meter novice band (7.15 to 7.20 MHz in those days) from stock xtals in the 6.95 to 7.10 MHz range. As I recall, all we used was a piece of window glass, some COMET or AJAX scouring powder, and plain ordinary tap water.

We were told that grinding should be done in a figure eight motion to assure an even grind, and also to try to only grind one side of the crystal. The grinding table was the window glass which was prepared with a couple drops of water on which the COMET had been sprinkled. We used the index finger directly on the crystal (no separate glass plate). After grinding, the crystals were washed and dried and from this point only handled by the edges.

I would estimate that our success rate was nearly 100% when grinding the crystal up 50 KHz or less. The failure rate increased as the frequency shift requirement increased. Also the crystal activity suffered and more chirpy signals resulted. I don't think we were able to achieve a shift of over 200 KHz with much luck. Anyway, don't ask me about stability of the crystal etc. but it was good enough to get us on the air.

I'm posting not to dispute anything Ron has posted....There's a right way and a not so right way....So if you have enough crystals, and want to get your feet wet, jump in!

Geeee.... We were poor kids - we'd unsolder the cover on the crystal
can, take a number 2 pencil and put a mark on the crystal surface.
The added mass would change the resonance frequency just enough to
get us out of the Extra band or into it...

Jim Stewart asked if there was a book (or whatever) that covers problems
and the tricks to finding and fixing them.

Unfortunately, no one book exists that covers the full range of problems
one is likely to encounter in troubleshooting equipment. There are a lot
of periodicals, books, articles, etc. about locating those hard-to-pin-down problems with TV's; and most of these come from guys with a lot of
experience with them. Many people keep a little "diary" in which they
list those "dog" problemsfor which some unusual repair was required.

Often, these rare problems/fixes apply only to one model or manufacturer; and may be tried on other equipment when all else fails.

Troubleshooting faults in radios, nd TV's, TV's, autos, and yes, even human bodies, requires a fair amount of knowledge of the BASICS on which their systems are built. You can get this from books, schools, etc. Further, good fast troubleshooting also requires a knowledge of the equipment itself and how it works---how it incorporates the BASICS you learned about in the books and schools. Here is where the experience comes in. The most well-read person who understands thoroughly the BASICS can't just go into a complex piece of gear and find a fault. A study of how it works is in order. By the rule of the Learning Curve, the more problems you deal with on a particular piece of gear, the better you get at finding and fixing problems with that gear. (Learning Curve = Experience).

Your own ability to keep your thoughts organized; to apply knowledge of past problems and their fixes; and the knowledge of and ability to follow a logical and methodical course of action are the catalyst that brings knowledge of BASICS and knowledge of equipment together to solve the problem at hand.

Many people reading this will recognize that the general problem-solving principles apply as well here as to determining why a product is losing market share. Why did I stress BASICS? Simply because a knowledge of the fundamentals is an absolute necessity without which knowledge of equipment is almost a hindrance; and proper experience canl not be gained.

With a thorough understanding of the BASICS you can find and fix a problem *eventually* on a piece of gear you've never seen before. Add a knowledge of how it works, and you find and fix it faster. Now add a year's experience on that gear, and it almost seems as if there is no problem.

True. I don't think they had R100 or R72A either. An (American) Icom rep claimed "production delays" of 6 months to a year.

WB6HQK, WB6ZSU, K6JRR, WA6CGR, myself and a few others are beginning to get our 10-meter-mobile plans ready for summertime vacations and driving, and we've got a couple of questions for those who regularly use 10 meters.

Since I hope that there'll be more than a few responses to these questions, please mail all response to

grian!puffin!wb6hqk@elroy.jpl.nasa.gov

You may also merely reply to this message and I'll forward the responses to HQK...

^L
**************10 Meter Propagation Survey***************

Please answer these questions based upon only your 10m experience of the past 12 months.

We are looking for specific information on achieved and predicted operation on 10m over a 100 - 2000 mile range zone.

For each question, please note any propagation differences between CW, voice (AM, FM, SSB) and packet operation.

The term "reliable" means at least marginal (or better) communications 50% of the time (in other words, the ability to exchange callsigns, signal strengths and locations during a short QSO).

1) How much power do you generally run on 10m?

2) How much power do the majority of your contacts on 10m use?

3) What type of antennas do you use for your various 10m operations?

4) During the daytime hours, what kind of range do you reliably expect and achieve on 10m?

5) During nighttime hours, what kind of range do you reliably expect and achieve on 10m?

6) For the upcoming 12 month period, predict a range over which a pair of 10m, 10-watt mobile installations could enjoy reliable communications.

Bonus Essay Question (10 extra points)

Given two to four hundred dollars and a 12-volt, trickle-charged car battery as your power source, which of the current 10-meter radios would you purchase and why? (Yes, you can spend the money ONLY on a 10m radio...)

Thanks for your time. I will post a summary of the information gathered via this Survey.

>these hermetics are a bear to work on, particularly the HC-18's and the
>little watch bar blanks.
>..............................

A few postings about altering FT-243 crystal frequencies have been put up here. I and a few others also used the ajax cleaner method of raising the frequencies with some degree of success. However, being a little over eager we over-shot the desired frequency range a few times (i.e., made the crystal blank too thin) and had to lower the frequency. Another poster described how to lower the frequency of FT-243 blanks by copper plating. We were not that clever. Instead what we did was rub a piece of solder on the crystal to build up the thickness. We found this to work to a limited degree and was able to lower the frequency by 5-10 kHz (kilo-cycles in those days). Any more solder that that amount seemed to kill off the blank. As I recall we got the solder idea from a Hints and Kinks article in QST or a republished H&K booklet.

Anybody out there know what the community now calls these measures?
cps, kmc, mickey-mikes.

I'll post the answer in a day or two.

4 I plan to build a crystal radio, using state-of-the-art IC's for the
5 *rest* of the unit.

x Well, gee, why not build a totally digital crystal set? For the detector,

Actually, I like this idea. Maybe a A/D and a DSP for processing.

You did miss my point that I still needed the cat's whisker and galena crystal (which I've already gotten). It's like a BBQ'd chicken: you can change the trimmings and still be a BBQ'd chicken, but you can't change the chicken. I can change the radio's trimmings and still be a crystal set, but I have to keep the galena crystal!

Thanks for your (unintentional) good idea. I'll probably do it.

There was an announcement from EEB in the Icom section of HamNet (Compuserve) that ICOM was recalling the R1, the R100, and the R72A wideband receivers from the US market. They (EEB) are recommending that their customers who have these radios on order cancel.

Trouble is, if you build a crystal set, what is there to listen to on it?   Just junk.

<Old Pharte Mode On>

Now, in my day, laddie, from G-land, you could hear the good old Beeb, as well as Radio Moscow. By suitable twiddling, you could also hear these guys chattering away to each other late at night - turned out to be "hams" or something. Nowadays the same old guys are chattering away, but it's all this modern SSB stuff that you can't understand on a crystal set, and the "AM" band is just junk. How's that going to turn anyone on to the joys of DXing and similar fine pastimes?   Grumble, grumble..

<Old Pharte Mode Off>

Anyone built the Radio Shack AM/ShortWave Radio (ages 2 and up)? I can hear 2, or at most 3, stations on mine, the selectivity is nil. I dunno, maybe it's all these modern transistor things etc - you never really know if they're working or not.   They don't light up or nuffink.

>
> It's about time they published something workable, using available parts. There have been lots of excellent but simple crystal-set articles in magazines like _Popular Electronics_ since the '60s. Does anybody out there have connections with the BSA publishing establishment?
>

I suspect they may be a lost cause... I remember the section in the radio/electronics merit badge manual about transistors in the early 1960s:

".... the transistor, made from small pieces of metal and a few thin wires, can amplify electrical signals more than a million times."

Now I bet the net didn't know that CK722s had that much Beta....

I am using AC-1 active antena for my SONY-ICF 2010. Most of the time
I play around tuning to All India Radio stations. Ever since I installed
this active antena, the signal strength of AIR is touching the maximum
even in the afternoon. Here is the catch. I cut open the loop of the
AC-1 antena and connected it to a 60feet external antena(wire). Also
there is absolutely no distortion/static/overload. Also I could able
to tune to AIR home services.

Now, I would like to know whether by coupling AC-1 and the external antenna
blows out the front end of my SONY-2010 or any other side effects.

Meaning they sent it back to engineering to design out the patent
conflict. There is no such thing as a production delay of such a
long period in Japan. The Japanese definitely have their act
together on the production line floor, stocking parts, etc. The
guys who don't have it together at all are the American sales

people.

Gee, if we all had access to a network analyzer, life would sure be greatly improved. However, a network analyzer of the quality you would expect from companies like HP and Tektronix are overkill for most amateur needs. A "poor man's" network analyzer might be a nice project or junk product for someone to make. It could be based on a sweep oscillator and feed into a PC for memory zeroing. Complex response would not be needed for many things, either. The PC software could be customizable to do nifty stuff like a Smith chart.

Brian,

At least in northern Colorado, you will want an HT with PL (subaudible tone) generation capability, NOT "tone burst". Many European (and a very few U.S.) repeaters require a tone burst on the front of a transmission (often 1800 Hz) to open the repeater. In this area, repeaters which are not completely carrier-controlled require a subaudible tone which is continuous during the duration of the transmission from the HT. This is sometimes used to implement "private" repeaters, but is coming into wider use as a means to control interference problems (unfortunately).

BTW, in used HT's, I'd go for one of the ICOM-02AT's, or a 2AT with an add-on PL generator. For a new model, I'd probably consider the Icom 2GAT for 2m only, or one of the new dual-band HT's (220 and 440 are both becoming more active in this area).

73,

John Schmidt, NK0R

Gosh, why not let the entire net know what these goodies are/were? It only seems fair after watching the traffic concerning them.

Rumor has it that space shuttle astronauts will communicate directly with their counterparts onboard the Soviet MIR stations. Is this true? If so, what are the schedule times and frequencies? I would also appreciate times and frequencies for amateur traffic between the shuttle and earth.

All leads appreciated,

Considering the Japanese Patent Office finally granted Texas Instruments a basic technology patent for inventing the integrated circut sometime in the summer of _1989_ it isn't all that surprising that the rig could still be selling in Japan.

(They also made the effective date sometime in the 60's so TI gets to collect royalties for about four or five more years. I think the Japanese courts awarded TI several tens of millions of dollars back royalties.)

I asked for a data sheet for the R1 at the ICOM booth.
An ICOM rep stated that the R1 was in production delay
so there were no samples or data sheets.

I didn't ask him why.

With a trip planned for the Sacramento, San Francisco area for the last week of June and the first two in July, does anyone know of any Hamfests underway in the area around those times? Specific dates aren't established, so I'm being somewhat vague. We're also planning a week in Los Angeles, but that is booked - start to finish.
Would appreciate info.

I believe the numbers station is a great way to send messages to remote areas without fear of looking suspicious on the receiving end. Multiband radios are common drug store items and don't look like spy equipment. Who wants to have crypto spy equipment laying around your house if you are involved in covert activities??? Remember in many 3rd world countries a search warrant may be non-existent and the authorities bust down your door and ramsack your place. If all you have is a little radio you look a lot less suspicious.

As far as the code goes remember that a SUBSTITUTION CIPHER is virtually un-crackable if you don't have the key. Like the famous Beale Cipher the key can be a common document like the Declaration of Independence.   If the people sending these messages are smart they will use a changing key such as the first letter of each word of the front page article in the local daily newspaper.

I believe that the numbers system is fairly secure as long
as you don't have a clue as to what the substitution cipher
key is derived from.

Hence all of this simplicity is fairly secure and doesn't require
a lot of expensive (and vulnerable to capture) crypto equipment.

That's my theory....
How'd I do... CIA???

UHF TV: well over this side of the Pond we have almost all our terrestrial
TV on UHF (Channels 21 through 68). Different countries use different
modulation methods and audio/video splits. We have PAL (most of Europe)
and SECAM (France) with 5.5, 6 or 6.6MHz audio/video splits.
Some also use inverse video modulation. Vive la Difference!
We *used* to have VHF TV (on 41 to 68MHz, 'Band 1' and 174 to 216MHz
'Band 3') 405 lines monochrome, but these stations are almost all gone now
(completely gone here in the UK some years ago).
The band 41-68MHz has over the last few years been reallocated to
land mobile (hams getting 50MHz) and likewise 174-216MHz has gone to a
trunked, digitally-controlled mobile service.
The band 66-88MHz was never used for TV in Europe (West europe has mobile radio
in there, some Eastern countries have FM broadcast radio in here too).
The European frequency allocations arent always understood by equipment makers;
for example the number of scanners imported with the 30-50MHz range enabled is
quite great - all you could hear until recently was TV video buzz! Should have
had 66-88MHz enabled for Europe, but seems 'nobody told the importers'! HI

There is a technical review/editorial on Paul Brodeur's "Currents of Death" in the April 1990 IEEE Antennas & Propagation Magazine (Vol. 32, No. 2). The reviewer (J. Robert Ashley, Ph.D., IEEE Fellow) concludes that Brodeur's book is "so much scientific error and malice."

Is it possible / feasible to use a Yaesu FT-23R as the base station for a CSI phone patch? A friend is trying to do just that, and was told he needs to connect to the 23R "before" the de-emphasis network, but even with the schematics he doesn't know where that is. Anyone with experience in this area? Adivce would be greatly appreciated. (He doesn't have b-board access.)

Thanks!

Bill

Dear all,

Being an aspiring linguist as well as an aspiring CW operator, I have come up with a list of words that occur frequently in English. The data comes from the so-called Brown Corpus. This is a large database of sentences from a wide variety of English text (with a notable bent towards journalism), and is considered to represent modern English prose fairly accurately. Appended below are the five hundred most common words. Since there isn't any amateur radio jargon in the list, the list is not so useful for practicing CW on software that will send you code from a text file. Does anybody have a list of Q-signals and common abbreviations? I can add them to the list, and make it more fun for CW random word practice. With, say, two hundred amateur radio words (including Q-signals and abbreviations), the list would grow to seven hundred words. If I could copy seven hundred words with the ease I copy "the", "fb", and "rst" (not to mention "CQ" and "73"), I would get much closer to ragchewing indeed. Any help and comments most welcome.

  On the high side of allowable range? Like more than 500W? Hmmmm.......
You may discover that the batteries for such a monster don't meet criterion :-)

I second John's opinions above. Particular brands to stay away from (in my opinion) are Yeasu (all of them) and probably some models of Kenwood. Also, the Icom IC-24AT might be one to avoid for a while until they start selling a better antenna (poor gain compared to other dual band flex types) and improving the display readability. Yeasu radios typically have poorly designed receivers and are subject to intermod and spurious reception.

I have purchased many Icom models and one Kenwood. Although Icom seems a bit stodgy (conservative) regarding features, they seem to make a very high quality and reliable product. The one Kenwood I bought (TH-21) has had nothing but problems.

The IC-2AT was a good model, but has no memories (thumbwheel switches set a single freq at a time). The IC-02AT was a good general purpose radio with all the features you are desiring. The IC-2GAT is also good if you want to run up to 7 watts of power. However, there is a tradeoff between power and battery life. I feel that 2-4 watts is a good range to stick with as you will still have adequate operating life, plus most repeaters will work fine with those power levels; especially in Colorado where most repeaters are 3 to 5 thousand feet above you! Icom also has very good service support. They have provided me with small parts for free and are always very helpful. Kenwood also seems to have good service support, but I recently had to order an electret microphone element for my TH-21. The mic element was about the size of an aspirin tablet and weighed maybe all of 1/100th of an ounce, but they insisted on charging $4.00 for "shipping and handling"! The part itself wasn't so bad (about 5.50).

As an aside, when I owned the IC-2AT, I was riding my motorcycle/sidecar rig down the highway at about 45 mph. It came unclipped from my belt, fell to the pavement, bounced up and hit the bottom of the sidecar, and again hit the pavement, then slid along the ground for a while. After all that, it still worked ok! Nice rig. I now have a IC-32AT and have come to really love it. At $550, it is not the cheapest radio, but it covers both 2m and 440MHz, has 20 memories, and can receive public service on VHF-Highband and UHF (with some simple mods).

Someone was asking about loop antennas (relating to new AEA product). Well i thought i would draw your attention to a British series of products; made by a company called CAP*CO. There are several versions on the theme; all are loops with tuning capacitors (loop mounted so its diameter is in the vertical plane). They do remote-tune versions so you can stick the beastie up a tower. Theres also receive-only versions. The transmit versions use thick tube (about 1.5 to 2 inch diameter), to keep losses down. I have had no personal experience of these loops, if anyone is interested I will post details and address (when i can find them). CAP*CO also do nice antenna tuners (lovely big silverplated roller-coaster coils and *W*I*D*E* spaced tuning capacitors; real beefy jobs). Price (and weight!) is as would be expected for such a style of manufacture (we are talking quite a few hundred pounds sterling) but having seen inside one, nothing short of hitting with a sledgehammer would damage it. If it was not for the TVI problems, i guess they could make a transparent-cased version and sell the thing as art. It really is beautifully engineered and constructed!

I just received a Spring 1990 flyer from G & G Communications
that may interest scanner hobbyists.

The flyer lists hundreds of used scanner "carcasses" and
parts for sale, as well as pagers, ICs, and crystals.
It states:

   "...Our specialty is scanner repair.
  We will attempt to fix most any scanner with few exceptions.
  The Bearcat 250s, 300s, and 210s that most shops
  are unable to repair, we fix daily..."

You can get a flyer by contacting:

     G & G Communications
     9247 Glenwood Drive
     Le Roy, NY 14482
     USA
     tel. 1(716)768-8151

Disclaimer: I have had no experience with G & G.   Call them, not me.

I remember those days -- I did get the kit, and got it to work
with the help of a neighbor TV repairman. The way I believe we got it going
was to *NOT* sand the turns on the coil, and substitute an air variable
capacitor for tuning. We spent about a half hour trying to get the galena
chunk to rectify, and after much frustration, finally tuned in a station but
with mediocre results. My mentor then left, but shortly returned with a
germanium diode! What a radio! :-)

Ok, guys -

I wasn't deliberately trying to be elusive. Those 3/8"
ceramic do-dads are from a ball mill. Several of them are
placed in a steel cylinder and rolled/tumbled for a few hours
to pulverize rocks or other brittle material. The dust
that is left is used for X-ray analysis. I have no idea
who the original poster was, or why he wanted the information.
He said somthing about a crime, so perhaps some of these things
were used as slingshot ammo - I dunno.

I posted this awhile ago and got no response....perhaps it didn't go out.

Does anyone keep the latest AMSAT bulletins on-line anywhere for anonymous FTP?

Someone was posting them to this newsgroup for awhile (KA9Q ??) but that action seems to have stopped.

The AMSAT BBS is nice...but continuously busy. I can perhaps offer to be the FTP site if someone will e-mail me current bulletins (including the AO-13 mode schedule please...)

Thanks. 73, N0JCF

(and Pat Barkey @ indiana.edu... I'll be e-mailing you shortly.
Our packet connection is gone again...)

You could use the antenna from the IC-32AT (FA-1443 or some such model).

This is true so long as the receiving party doesn't need the information within a week of receipt :-). This mode doesn't break any speed records.

My theory is that the numbers stations ARE in fact the key to some cipher that is transmitted via a different medium...

For those not familiar with NEC, it is a numerical code developed primarily for the analysis of antennas. I've been searching for it, but it doesn't seem to be available unless you need it, and then you have to prove it, and then you have to pay. It, of course, was developed and is distributed by our government. We certainly wouldn't want foreign nationals developing nuclear wire antennas!

Next - thanks to all those that responded to my request for information. I appreciate your efforts and hope this serves everyone well.

Anyway, there are products that are available both free and commercially that can fill the gaps. Here is what I know:

MININEC was develped in 1982 by A Julian, J Logan, and J Rockway at the Naval Ocean Systems Center (NOSC). It is described in Technical Document 516. It is a single program written in BASIC and is intended to be run on a PC. It is a scaled down NEC, but it is very adequate for Ham type antenna design and analysis. For "grounds", you get no ground, or a perfect ground. You can do the standard pattern runs, determine impedence, etc. Input must be in meters (a pain). I don't know where it is available, but you'd want MININEC3 anyway - which is available.

MININEC3 is a successor to MININEC. It was developed in 1986 by J Logan, and J Rockway at the NOSC. It is described in TD 938. It consists of several programs: MNPRE - a pre processor for NEC input files, MININEC3 - the workhorse, and MNPOST - a post processor for munging the various data computed by MININEC3. Some of the new bennies include: 1) input of NEC files (instead of by hand each time) via MNPRE, 2) computation of both near fields, 3) field patterns in DB or V/M, 4) more flexibility in saving different data to different files, 5) Specification of specific ground wires if desired (or use perfect), 6) it computes the wire endpoint connections for you, and 7) and a host of plotting options (none graphical - just data selection). This is written in BASIC. The .ARC file includes both DOS compiled executables in addition to the sources. GWBASIC won't run the sources for some reason. Sizing can be a problem for a complex antenna (about 50 segments or so is the limit without rebuilding them). These crunch numbers, so the faster the CPU, the better. If you have a BASIC compiler and a math co-processor, you're really set. MININEC3 is available from the simtel server on the internet. It's in the PC ham radio subdirectories. Suck it down, un-arc it, and you're off. You can figure out most of it w/o the document. Input, again, is in meters

Just mail the following line to "listserv@vm.ecs.rpi.edu"

```
     /PDGET MAIL PD1:<MSDOS.HAMRADIO>MININEC3.ARC UUENCODE
```

There is a wealth of other neat stuff on simtel also - ham, pc, etc.

By the way, I tried to order the TD from NOSC. They told me that it wasn't available unless I was a Gov contractor and needed it. So, I went to the campus library and copied it. You'll need to go to the special government docuements librarian to find it. It isn't in the card catalogs.

NOSC
5285 Port Royal Rd.
Springfield, VA 22161
(703) 487-4650

MININEC3 is free and works well. You can complement it with some utilities that graph the patterns on you're screen. While it's fairly well written BASIC, it would be a chore to port to C (if somebody ports it, I want it)

YAGINEC. YAGINEC is under active development by Lew Gordon, K4VX. It was described in the March '89 QST under technical cooerespondence. I have version 7.01 and it is super. It contains several programs:

GAMMA - for gamma matching computations, TAPER - for composite tubing element length equivalents, HAIRPIN - for hairpin matches, and YN - the Yagi optomizer program.
YAGINEC is written in QuickBasic and is shipped w/o sources. He does give some sample antenna input files. Some of the features are 1) non metric dimensions, 2) very slick data and menu input, 3) file input, 4) very slick and feature full plotting options (to screen or printer), 5) automatic frequency sweeps, and, 6) an optomizer - you can have it optomize a given design to your constraints (gain, f/b, etc). It is a very nice package. It is available for the super bargain price of $5.00 directly from the author. You'll get your disk in 2 weeks or less. My only beef with this program is that the YN program itself only works on YAGI antennas. (I play around alot with other antenna configurations.) Hopefully he'll add an arbitrary input menu to it. It is based upon MININEC1.

NOTE: I have a fortran version of MININEC which I'll describe later. Briefly, while fortnec (MININEC) and MININEC3 give me different answers for the same configurations, they're both close, and they both converge to the same numbers. Just slightly different algorithms. (MININEC3 does seem to converge faster, however). Note that you should read the documents to learn about the "problem" areas - such as needing more segments for anti-resonance situations, etc. This will help you get convergence faster and get more accurate answers if you don't bother with the convergence tests.

FORTNEC. FORTNEC was reviewd in the Feb 1990 issue of RF Design magazine. It is basically a fortran version of MININEC1. Good news for us workstation folk! The article was by Alan Carr. It has minor input and output format changes, but is basically MININEC1. You get both compiled fortran (for a PC), and the fortran sources. It was a minimal porting effort to port it to my DG AVIION workstation.
I use this extensively as it runs on my workstation which 1) is a fast risc machine, and 2) has native fp support. A five minute run on a 10 MHZ '286 takes about 30 seconds on my workstation. As the interface is primitive (for PC stuff), I've written a bunch of pre and post filters to support it. (Kind of like that Star Trek probe "Voyager" that comes back as "Veger") Anyway, it is available for $9.00 from RF Design Magazine. Order "Disk RFD-0290: February 1990" from:

RF Design Software Service
P.O. Box 3702
Littleton, Colorado,
80161-3702

MN3.0 This is the Brian Bezzley, K6STI, software. It was reviewed in several recent issues of Ham Radio Magazine. It is, of course feature laden with free form input, frequency sweeps, lots of pulses, speed optomizations, automatically finds the take off angles, computes the max gain, f/b radio, patterns, swr, etc....(I'm reading this from his Ad in the May 1990 Ham Radio issue on page 74).
It got a good review. My biggest beef is that it costs $110. A MNjr

costs $55 (don't know content). I haven't been able to get my hands on a copy locally to play with it. Also, 1) I'm cheap, 2) and it won't run on my workstation anyway (yea-yea - get a PC; I know....)

YO3.0 is a similar product also by Brian. Lots of nifty features for basic design and optomizations. Stuff for stacking, speed improvements, etc. It includes support for designing gamma, T, hairpin, and beta matches, taper computations, frequency scaling, and others. (again, I'm reading the ad) It also was reviewed in a recent HR issue (they were in subsequent issues). He wants $130 for this puppy, and, of course, to bait you, has a Jr version for $65.

The reviews for MN3.0 and YO3.0 were good, but they are pricey - esp for us hamfest hounds. Seems like Brian and Lew are duking it out for price/performance features on YO3.0 vs YAGINEC.

Brian Beezley, K6STI
507-1/2 Taylor,
Vista, CA 92084

ELNEC. ELNEC is a product from Row Lewallen, W7EL. It is based upon MININEC. I havent seen a review of this, nor have I tried it. I'm reading this from the same issue of HR (May 1990) on page 78. It, like MN3.0, has automatic pulse placement (VERY NICE), and has builtin plotting, printing, etc. He touts "true current sources". Offhand, it appears to be MININEC with auto source placement, current sources, and some plotting features. It is available for $49.00.

Row Lewallen, W7EL
P.O. Box 6658
Beaverton, OR 97007

So! That is what I've learned from my research.

If you'd just like to tinker, I'd chose (not in order)

1) MININEC3. Flexible, and free

2) FORTNEC. Not quite as good, $9.00 and the sources sources are probably usable on a non pc workstation. You'd drop $9.00 on a 'coupla beers after work.

3) YAGINEC. Wonderful if you're into Yagi beams. great if you just want the harpin and other utilities. $5.00 You'd drop $5.00 during lunch.

If you're into heavy modeling, I'd chose (not in order)

1) FORTNEC (just because you might have a mainframe or a risc workstation lying around - *speed*) $9.00

2) MN3.0 and YO3.0 These seem to be very fully featured
and very nice. You pay for it also. $110 and $130.
You'd drop that on a Bencher paddle.....

3) YAGINEC It doesn't seem to have *quite* the features
of YO, but is sure looks close. $5.00 (Rumour has it
that Lew designed the "elephant gun" (10 element 10M beam
- 45 foot mast) with it.

In addition, most of the magazines bookstores sell MICROSMITH (sp?)
which has graphical and computer solution of smith chart type
problems. $49 (I think). I haven't looked at this yet.

These opinions are my own, and I hope I haven't miss represented
any products. Let me hear from you - with reviews of the ones I haven't
played with, or ,especially if you port MININEC3 to "C".

regards,
Mike Harris - KM4UL harrism@dg-rtp.dg.com

><Old Pharte Mode On>

True, alas. But back in olden times, I was first introduced to the magic of radio via a crystal set. I was in elementary school, an era marked by by Sputnik, the hula-hoop and a little gadget called a 'rocket radio'. This was a little crystal set shaped like a v2 rocket. It worked! Of course, I immediately tore mine apart to see what was inside. That this little collection of strange objects could actually make sounds was utterly facinating. I built dozens of different crystal sets of dubious technical merit. Most of them worked!

A few years later, my family moved to within five miles of KVOO radio - a 50Kw 'clear channel' am broadcast station with a phased array of 3 *HUGE* verticals. I could no longer get anything else, but reception of KVOO was fantanstic! A simple crystal detector could even drive a small speaker. In fact, just about anything metalic in the house was a potential receiver.

I learned the code while throwing my paper route. A friend and I would ride our bikes and whistle back and forth. When we went for our Novice tickets, the test was given by a Ham that lived within a mile of the KVOO towers. When he turned his garbage disposal on, you could plainly hear (very distorted) music coming from beneath the sink :-)

What kind of problems have you had? I've had a TH21AT for 3-4 years,
and it's never hiccupped once. I've also had an ICOM 2AT for about 8
years and a Kenwood 7600 mobile rig for 10 years; both have been
very reliable.

Is there any real evidence that there even will *be* any ATV (FS or SS)
on STS-35?

I know there was a mention of it in a NASA press release, but I haven't
seen any mention in the materials from the ARRL, and I trust them more
than I do NASA on this one.

Hello out there in Net-Land...

I picked up a Motorola MX-330S while I was in Dayton last month.
It's a 48 channel PROM programmable 2.5 watt HT.
Does anyone know of a source that other than Motorola that is

willing to sell and program a PROM unit at a reasonable price ??
I beleive Motorola wants something like 150 dollars for their services !

My second question is...

Does anyone know of any MT-1000 on UHF that can be configured to go
from 430-480 Mhz or wider ??? Is the relatively narrow bandwidth a limitation
of the software used to program it or of the radio itself ??

Anyone who has a similar interest in Motorola equipment can get in touch with
me via E-Mail.

> making it illegal to sell equipment capable of receiving cell phone calls...

There is no such prohibition. If you think there is, provide a citation.

> The fact that the latter is
> in direct conflict with the Radio Act doesn't seem to bother the lawmakers.

The ECPA supersedes the Communications Act of 1934 (in the area under
discussion.) There is no conflict. Both are reasonable, Constitutional

statutes which attempt to balance the rights of users of the spectrum and the rights of random radio listeners. The fact that the random listeners were further restricted by the ECPA is a matter of public policy; if you don't like the policy you should change it by intense lobbying of your own.

> This subject has been discussed at great length in the moderated comp.dcom.telecom group. That's the best place to go for detailed, specific info on this topic.

If your information came from that group, you should go back to them and get more accurate information.

I'm from northern Ohio (by Toledo) which does not seem significantly different in lattitude from New York. I run a el-cheapo home-brew dipole on 10M and it seems that all I can hit is Texas (slightly exaggerated...). Bottom-line - 10M does work just fine for that distance. But other than that - don't ask me, I'm just a lowly tech :^).

I don't doubt it at all. You only have to listen to some phone pile-ups on HF to be convinced that there are many hams who are about this age.

I forgot to mention some things about the callbook server available via email to callbook@sat.datapoint.com.

First, there is an additional command, "path", that may be included in your message to specify a return address. Normally this should not be required, but if your requests seem to go unanswered, you might try it. Either a domain specification or a bang-path is acceptable.

Examples:

```
        path bob@foo.com
        path uunet!foo!bob
```

Second, the database includes only FCC assigned (U.S.) callsigns, but it does NOT include club stations. Club station information does not appear to be available from the FCC in machine readable form.

I have updated the help file to include the above information.

About the lack of spectrum space for the Land Modile service, it seems to me, that the UHF television channels are underutilized. In rochester we have channels 21 and 31, what is the rest of the space from ~500 -> ~800 MHz used for, if anything?

73,

Jim

The folks on the Evergreen Intertie, which is a network of repeaters here in the Pacific NW, semi-regularly do this sort of thing on Tuesday evenings. A "local net control" station will autopatch into a distant repeater, where another station acts as net control in that area. I've said Hi into Atlanta and Ohio while mobiling home from work over that setup.

A related fun thing they do on the Intertie is tie in an HF big gun station for some real DXing. Last Christmas I used my 2 meter micro HT in a room in Timberline Lodge on Mt. Hood, Oregon, to exchange New Year greetings with hams in Beijing via the Intertie and a big HF station in Seattle.

This sort of thing is a very good idea.

True! Very true, at least for now. Current domestic analog cellular communications use traditional FM transmission characteristics at least for the voice channels. The only thing that may provide a bit of a problem for eavesdroppers is that the in-progress call may migrate (hand-off) to another channel at any time so the listener will either need to hunt for the new channel or find another interesting conversation on another channel.

The beginning of the end of this is near however. The analog RF transmission will soon begin to be replaced by digital RF transmission where the base station equipement will transceive along with the mobile subscriber unit in a proprietary, digital format. It will still be possible to tune some scanner or piece of equipement to a busy channel but all that will be heard will be the bumble-bee buzz of the digital transactions. While I wouldnt say that it would be impossible to decode this, those thinking of it will be sumpremely challenged: One RF radio channel will have several digital voice channels multiplexed onto it and will be encoded using some pretty high-speed digital signal processors.

Like everything, this will take a little time but the scenarios like Dave described will soon disappear.

>I can get a set?

The crystals in question were galena; find a rockhound or hobby shop and you should have no trouble locating some. A bottle cap and some solid solder, heated on a stove, will give you a bottom contact (just drop the galena in; it'll float).

An old fashioned safety pin makes a good probe.

Variations on galena are possible: almost anything chrome plated, or a steel razor blade (with the blueing etched off) works fairly well.
In fact, I once took a crystal earphone, held the barrel of the connector in my fingers and 'grounded' the tip to a variety of household metal surfaces. Most of them rectified somewhat.
An old variation on a cat's whisker was a "coherer"; this was a glass tube with metal chips. When the rectification failed, one simply shook the tube to change the chips' contact points.

The VEs here allow the use of typewriters.  In discussing it, they felt
that it was ok, but would probably test them by themselves, so others
wouldn't be annoyed by the noise.

>Add into that
>the illogical (for a child) layout of a QWERTY keyboard and this story

My old cub scout handbook said to use a safety pin and a piece of galena (lead crystal). You probe the galena until you find a spot that behaves like a diode.

I'd rather use a 1N34. :-)

=========
SpaceNews
=========

MONDAY MAY 7, 1990

SpaceNews is published and distributed weekly around the world on USENET and Amateur Packet Radio. It is available for unlimited distribution.

* STS-31 NEWS *
===============
STS-31 POSTFLIGHT CREW PRESS CONFERENCE SET

The STS-31 astronaut crew will meet with news media at the Johnson Space Center on Wednesday, May 9, to discuss the recent mission to deploy the Hubble

Space Telescope. The event will begin at noon EDT and consist of a slide and video presentation by the astronauts, followed by media questions.

News media may participate in JSC building 2, room 135, or via two-way communications from NASA Headquarters, Washington, D.C., the Goddard Space Flight Center, Greenbelt, Md., the Kennedy Space Center, Fla., or the Marshall Space Flight Center, Huntsville, Ala.

Live NASA Select television coverage will be carried on Satcom F2R, transponder 13, 72 degrees west longitude, frequency 3960.0 MHz.

[From: Peter E. Yee @ NASA Ames Research Center, Moffett Field, CA.]

* STS-35 NEWS *

Launch of Columbia on the STS-35/Astro-1 mission remains targeted for May 16. The official launch date will be set at the Flight Readiness Review to be held May 7-8.

Astronaut and ham-radio operator Dr. Ron Parise (WA4SIR) will be carrying an Amateur Radio station with him on this mission and will contact other ham-radio operators on the earth below from the space shuttle.

* OSCAR-11 NEWS *

ASCII Single Event Upset (SEU) downloads have been suspended. OSCAR-11 is now transmitting Whole Orbit Data (WOD) and SEU data in a new "packetized" format. The general format is as follows:

```
S0 S1 ID T0 T1 T2 T3 T4 T5 F0 F1 D0 D1...D63 C0 C1

S0,S1  : SYNC MSB,LSB
ID     : Data Ident
T0..T5 : Timestamp
F0,F1  : Frame Counter MSB,LSB
D0..D63: 64 Data bytes
C0,C1  : Checksum MSB,LSB
```

Here is an On-Board Computer (OBC) status information bulletin received from OSCAR-11 on 05-May-90 at 01:47:17 UTC:

```
* UOSAT-2 OBC STATUS INFORMATION *

DIARY OPERATING SYSTEM V3.1 SMH MLJM MSH

 Today's date is 5 /5 /90  (Saturday)
 Time is 1 :47 :17 UTC
 Auto Mode is selected
 Spin Period is - 274
 Z Mag firings  = 0
 + SPIN firings = 3
 - SPIN firings = 1
 SEU count      = 6
 RAM WASH pointer at E20D
 WOD commenced 5 /5 /90 at 0 :0 :9
 with channels 10 ,11 ,19 ,29 ,
 Last cmnd was 109 to 0 , 0
 Attitude control initiated, mode 1
 Data collection in progress
 Digitalker active
```

* NEW PACKET PATHS *

SpaceNews has been sent out to: SPACE @ AMSAT for several weeks now, but judging from the mail I have received, I am returning to: SPACE @ ALLBBS. This change should clear up the distribution problems that have been occuring recently. Any comments on this change would be appreciated.

* FEEDBACK WELCOMED *

Feedback regarding SpaceNews can be directed to the editor (John) via any of the following paths:

> Thanks to intense lobbying by the cellular phone industry, a law was passed making it illegal to sell equipment capable of receiving cell phone calls or to listen to such calls. The implication of the former is that scanners sold new have the cell frequencies blocked, usually by the installation of a diode which most people easily find out how to remove. The fact that the latter is in direct conflict with the Radio Act doesn't seem to bother the lawmakers. The end result is that it is both possible and illegal to listen to cell phone calls.

The ECPA prohibits reception and listening of cellular (and some other) type of communications. Scanners and receivers with the capability to receive the frequencies cellular is on are still done legally, and are even needed for some non-cellular applications (such as monitoring for harmonics of your 2 meter transmission in order to verify compliance with FCC rules on spectral purity, including the sixth harmonic which happens to be on the cellular base transmit band).

> This subject has been discussed at great length in the moderated comp.dcom.telecom group. That's the best place to go for detailed, specific info on this topic.

Has comp.dcom.telecom's moderator been filtering out the truth of this like most of the cellular salesmen do?

After I got my Icom IC-2GAT I was having trouble getting the tone encoder (built-in) to work right. I was trying to HEAR the tone on my scanner, but could not.

A few weeks later I finally installed the UT-40 tone squelch option. It is a board that replaces the tone encoder board and performs both encode and decode functions. When I removed the tone encoder, I found a bent pin. It was the power supply pin and was bent all the way to the side and never made contact.

Once the UT-40 was in, I could hear 250.3 Hz through the scanner.

There are always these little manufacturing glitches.

Yup, that was what always seemed to happen just as the conversations got interesting. You would need lots more equipment to do a really proper job of tracking down one desired phone of interest and keeping up both sides of the conversation. One big problem was that the person being talked to (the normal land line, not the mobile phone) was very faint. I was told that the only reason we got both sides on the same demodulator was that we were picking up energy mismatches (bad impedance matching) from the land line when it was sent to the cellular. That would make sense, since some conversations could only pick up the mobile side or the land side. Most conversations were legible on both sides, though.

I'm not sure if this will true. I figure that to keep costs of cellular down, they won't go to anything too expensive like TDMA or packet. Takes too much inside the phone, and makes the current system obsolete. They may digitize, (probably will) but the transmission will be some kind of fairly simple scheme that fits into today's FDMA mode of operation (It is FDMA isn't it? At least, that is my understanding of how cell phones work. I could be wrong) Simple encoding schemes mean simple answers for tuning in, like taking a scanner output tuned to the cellular bands and feeding it into an old defective cell phone that understands decoding digital stuff. In fact, it might not be that hard to just trick your phone into receiving the same signal being sent to the active party. Since you wouldn't have transmit capability, you would be merely eavesdropping. Also, don't think that just because you scramble doesn't mean you can't be tuned into. There are going to be a proliferation of cellular test sets and various other pieces of equipment that are quite capable of the job. Who would have ever thought one could use a spectrum analyzer (and a paper clip) available off the shelf to do this? Not me, until I was shown. I still stick to my original premise:

If you want to make it private, DONT'T do it on cellular.

>
>Like everything, this will take a little time but the scenarios like
>Dave described will soon disappear.

Time will just up the stakes and introduce new wrinkles and variations on the theme. Most folks will cease to be able to get clear cellular broadcasts, but there are always the techno-zoids that will figure it out for kicks. And the CIA. And the FBI. And the NSA. And the.........

> Mike

-dave

P.S. - As a side note, how many folks read Tom Clancy's book called, "Clear and Present Danger"? In it, Mr. Clancy describes a very interesting means of tuning into cellular phones in Columbia to nab high profile drug dealers, all done by members of the U.S. Govt. Very High tech, more than just slightly believable. Does he know something we don't? If you want more info, read the book. It's very good, and I don't want to spoil it for those that haven't yet read the novel.

FYI.....

The N8EMR HAM BBS took a hard disk crashed yesterday...
I am attempting to put the system back togeather.. It will however
take a few days to get my disk referbished or replace. (need to round up
some cash). Until I get the system up again, the ARRL bulletins,w5yi,
qex,and the vk2sg rtty reports normally posted from my system will not
be posted. Sorry for any inconvience the system down time may cause.

I still think this is another of those urban legends, perhaps even a deliberate invention. But even if it is true, it is just one more piece of evidence that the code test is a meaningless waste of time for anyone of any age.

I took a lot of flack when I asked once in the Fidonet HAM conference, "If ham radio did not exist and you were given the job of inventing it, would you include a code test and why?"

In a recent posting, John Broughton (WB9VGJ) related his experiences as a military CW interceptor. He mentioned that he could eventually carry on conversations while copying CW. This brought something to my mind.

I have been a ham for >20 years, and CW is enjoyable and no hassle at all. 20-30 WPM is routine. However, I have found that I simply cannot speak while sending. Listening to others speak, even while copying CW, is easy, but I can't utter a sound while sending. I suspect that the fact I'm left-handed has something to do with it (you know, brain organization and all that).

Has anyone else encountered this, or have any suggested interpretation?

In response to W9IP's note about not being able to talk and send, I'm rirht right handed am in the same boat. I can read the paper and copy/send cw, copy two CW signals at once, copy and send at the same time, walk and chew gum at the same time, but I can't talk and send. As I type this I have just discovered that I can't type and talk either. I think I have multiple input ports but only one output port.

Ok all you ham/pilots (and there are many). I am looking to link my Dave Clark H10-30 headset to my Yaesu 208R with the little round plug type connector. Does anybody have any experience in this? How 'bout putting any headset on a 208? Most of the retailers I saw want about 50 bucks for a Yaesu installation, that a little steep.

This is a reply to Bert Campbell, N5KGT, regarding his request for info about some details regarding computer control of the ICOM R9000. I don't have easy access to Usenet to EMail Bert, and there might be more than two of us out there with R9000s, so please excuse the reply via the group.

To read a memory (say Memory 321) on the R9000, send the following sequence of packets:

```
Set memory:          FE FE 2A F1 8 3 21 FD
Read freq:           FE FE 2A F1 3 FD
Read mode:           FE FE 2A F1 4 FD
```

(the above assumes the R9000's address is 2A, which is the default, and the computer's address is F1. All bytes are hex.)

To set a memory (for example to set Memory 456 to 1234.567890 MHz FM medium), send:

```
Set memory:          FE FE 2A F1 8 4 56 FD
Set freq:            FE FE 2A F1 5 90 78 56 34 12 FD
Set mode:            FE FE 2A F1 6 5 2 FD
Write VFO to mem:    FE FE 2A F1 9 FD
```

Here are some new commands which work on the R9000:

Command E followed by a second byte (subcommand) of 0 makes the radio stop scanning if it is scanning. However, I haven't been able to make it START scanning. Example: FE FE 2A F1 E 0 FD.

Command 10 followed by a subcommand sets the tuning step. Subcommand 0 sets 10 Hz, 1 sets it to 100 Hz, up to subcommand 9 which sets it to 100 kHz. I haven't found out how to READ the tuning step, however.

Command 11 followed by a subcommand sets the attenuator. Subcommand 00 turns it off, 10 sets it to 10 dB, 20 sets it to 20 dB, 30 sets it to 30 dB.

Command 12 followed by 0 turns the antenna select OFF. Command 12 followed by 1 turns it ON.

Command 13 replies with a positive response (FB) but I can't see what the heck it does. My best guess would be that it makes the optional speech synthesizer speak the frequency, if you have one, which I don't.

Command 14 followed by a subcommand and a data byte sets AF gain, RF gain or the squelch level. Subcommand 01 sets AF gain to a value from 0 to 255 given in the data byte. Similarly subcommand 02 sets RF gain and 03 sets the squelch level. For example, FE FE 2A F1 14 01 80 FD would set the AF gain to a value of 128. It's obviously best to debug this one while NOT using headphones with the R9000.

Command 15 reads the S-meter. The reply message contains a data byte with a value from 0 to 255 which represents the current S-meter reading.

One of the mysteries of life is why ICOM USA is told so little about the computer interfaces on their rigs. I called ICOM and talked to Tom Moore of ICOM Customer Service, who is very helpful. He told me about Commands 11, 14 and 15. I found the others by experimenting. Don't they work all the time? Don't all R9000s have them?

Incidentally, I haven't had a whole lot of luck with baud rates above 1200. That goes for all the ICOM rigs, not just the R9000.

If anyone knows what Command 13 does, how to read the tuning step size, or how to start scanning, I'd certainly appreciate knowing.

If you are referring to:
26.995, 27.045, 27.095, 27.145, 27.195
then you are referring to the Class "C" frequencies. These are intended
for non voice use. These frequencies are mostly used for remote
control applications. Radio Shack uses some of these frequencies for
their remote control cars, etc..

Is this what you were referring to?

I have a PK-232 and had been running the PC-Pakratt software for over a year on a genuine AT without incident.

I have recently put a 386SX in the shack and find that there is a timing dependency in the PC-Pakratt software that prevents it from operating. The software indicates that it is "Unable to establish communications with Pakratt" and terminates.

When I called the tech support at AEA, they told me that indeed there was a timing dependency in the PC-Pakratt software and that the original authors of the code were nowhere to be found. I asked about a fix and they indicated that they had a new program that was going to be released during the summer. At that point, owners of PC-Pakratt would be offered a "deal", I was told.

So it looks like the near term solution is to patch the timing loop to eliminate the problem. To save the time, has anyone on the net hacked/patched PC-Pakratt to eliminate this problem?

I'm interested in finding out the current state of Slow Scan Television -- preferably information about non-digital SSTV. Are there scan converters readily available to encode TV images into voice-bandwidth transmissions? Anything low-cost? What's "typical" (time-wise) for a complete 525 line transmission? What is available in the way of a decoder? Thanks in advance for the information -- No, I'm not a Ham Radio operator; I have a friend who is looking for this information (he doesn't have access to the network).

And maybe the Navy's submarine communication system is causing the core to saturate :-).

Being next to a large body of nonconductive water may cause just as many strange problems.

Not true. Sale is not outlawed, but Uniden and Radio Shack both have
a large interest in cellular phones.   If that were true, the Icom
R-7000, R-9000, and Yaesu FRG-9600 would have disappeared years ago.

On tonights Wall Street Week, the guest paper hanger said that in two years
the digital cellular phones will allow three times as many conversations.

But he said that the next generation after that will give another threefold increase. Is digital voice technology good enough so that 9 (Toll quality) conversations can take place in the 60 Khz of spectrum used by one analog cellular conversation? (Or is someone elses spectrum going to get used)

Here here, Bob. As a former feature writer for Ham Radio Horizons (remember that one?--late 1970s/early 1980s) published by the Ham Radio Group, I'll miss them as well. Let's hope they continue in some fashion under the new CQ ownership. --Randy Padawer

**** UoSAT-OSCAR-11 BULLETIN - 215   03rd May   1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

* NEW DATA FORMATS *

The new Forth-Diary binary packetised data format is:

S0 S1 ID T0 T1 T2 T3 T4 T5 F0 F1 D0 D1...D63 C0 C1

S0,S1 : SYNC MSB,LSB
ID   : Data Ident
T0..T5 : Timestamp
F0,F1 : Frame Counter MSB,LSB
D0..D63: 64 Data bytes
C0,C1 : Checksum MSB,LSB

1.SYNC

5041h for UoSAT-2, 4534h for UoSAT-3.

2.ID

01 Engineering frame. 1 packet

02 Memory dump. Variable number of packets, only for debug purposes
03 Telemetry. 3 packets
04 SEU data. 10 packets
05 Extended Engineering. 2 packets
80h..FFh WOD

The WOD ID byte is incremented every time a new WOD survey is started.
It starts with 80h, and goes to FFh before going back to 80h.
UoSAT-2 WOD outputs 372 packets, UoSAT-3 WOD is 352 packets.

3.Timestamp

Each frame is timestamped at transmission.
T0 is seconds, T1 minutes, T2 hour, T3 the day, T4 the
month and T5 the year. All are in BCD format.

4.Frame counter

Each frame is numbered according to the number of packets, as
specified in 2:ID.

5.DATA

5.1.Engineering frame

Byte
0: Day number. 1=Sunday, 7=Saturday.
1: NA
2: WOD survey start seconds (BCD)
3: '' minutes
4: '' hours
5: '' day
6: '' month
7: '' year
8: Diary Mode: 0=Auto, 1=Manual.
9: Last command received.
10: Command set/reset.
11: Command data.
12: Attitude control active.
13: Attitude control mode: 1=spin, 2=Mag Lock, 3=delib, 4=1 and 3.
14: WOD collection in progress.
15: WOD # channels
16: 1st WOD channel
.. ... ''
25: 10th ''
26: WOD Survey Number
27: Total SEU's (MSB)
28: '' (LSB)
29: WASH RAM pointer (MSB)
30: '' (LSB)

31: Manual mode time-out counter (minutes)

Followed by 32 bytes of engineering data.

5.2 Memory

Memory dump, variable number of packets.

5.3 Telemetry

Each TLM channel uses 2 bytes.

5.4 SEU

Each of the 64 SEU entries:

T0 T1 T2 T3 T4 T5 A0 A1 C0 C1

T0..T5 : time of SEU detection
A0, A1 : address of the SEU (msb,lsb)
C0, C1 : SEU counter (msb,lsb).

ASCII download of SEU has now been stopped.

7.5 Extended Engineering data

These are two frames of variable data, mainly Attitude Control related.

5.6 WOD

Frame 0: T0..T5 N C0..C9 wod data..
All other frames: wod data

```
T0..T5 : survey start time
N      : number of channels
C0..C9 : WOD channels
wod data: (4 channel example)

 byte0 byte1 byte2 byte3 byte4 byte5 byte6 ...
 MS MD LS MS MD LS MS MD LS MS MD LS MS MD LS ...
 Channel1 Channel2 Channel3 Channel4 Channel1 Channel2 ...
```

MS: MSnibble, MD: Middle nibble, LS: LSnibble.

ASCII WOD: the checksum on UoSAT-3 should now add up to 204 (CC hex).

6.Checksum

Byte wise addition of all bytes, modulo 10000h.

** BID **

Please use BID $UOSAT.215 for PBBS use.

Amiga Video Terminal is a software and hardware product for Amiga computer by AEA. It can do SSTV in colour, rx WEFAX, NEWSFAX, group 1,2 fax,over phone sending and receiving pictures w/many image processing utilities, it can be hooked up to phone line, transceiver etc. (it is a kind of modem).

I read it in QST and talked to a ham today at an Amiga dealer looking at the the brand new demo unit of Amiga 3000! (M68030/68882 25Mhz, 8 VLSI custom chips and the new OS is very professional). check out the comp.sys.amiga(.tech/.hardware) on usenet. He uses the AVT above and he likes it a lot, sending color SSTV on HF all over!

I'm not sure what a non-conductor would have to do with propagation problems. In the normal case, your antenna is next to a large body of (non-conducting) air when you transmit, and that doesn't seem to cause too many problems. Why would water?

I too wondered about the Navy ELF project and it's effect on the 'black hole' phenomena. I think these problems may have dated back to before that antenna network was even thought of, though. Still, you have to wonder if the powers that be thought about all that iron before they started digging trenches for their antenna grid. Is it finished yet? Last time I was in the UP, the environmentalists were still fighting hard.

(posting this for Jim Reisert AD1C):

QST de W1AW
DX Bulletin 18 ARLD018
>From ARRL Headquarters
Newington CT May 4, 1990
To all Radio Amateurs

Thanks to Paul, KB1BE and the Connecticut DX Association for the following DX information.

>From the DXCC desk. Do not submit QSL cards for Walvis Bay before June 1. Cards submitted before that date will be returned with no credit. DXCC credit for Walvis Bay will be given for contacts on or after September 1, 1977.

Spratly. 1S0XV The Russian group is still active. They are waiting for a new generator as well as additional fuel. They should be back on the air by May 4th and operating for about 10 days. The QSL route is still in question, but it is possible that a stateside manager is in the works.

South Yemen. A very good possibility for an operation on May 19th with 9K2 operators. They have received verbal permission and written permission is expected soon. Keep your fingers crossed and your radios warmed up.

Conway Reef. 3D2 Another mid May DXpedition to the South Pacific by part of the recent Jarvis team of Martti, OH2BH, Wayne, N7NG, and Ron, ZL1AMO. They will be joined by Matt, SM7PKK. These DXers, with good conditions, could really do a big job on the recently new DXCC country island.

Rotuma. 3D2 Bing, VK2BCH, will make his third visit and amateur operation from Rotuma in the South Pacific starting on May 20th. Bing will operate 80 through 10 meters using mostly SSB with some CW. QSL to his home call.

Cocos Keellng Island. VK9 May 19 to 26 operation of VK9EW by WC5N, and VK9WB by W5EW.

Dodecanese. SV5 Starting May 21st for 10 days, N2OO, WA3TYF and SV0AA will sign /SV5. They will also be in the WPX CW contest and will be active on 160 through 10 meters on both CW and SSB before and after the contest.

Kerguelen Island. FT4XG, Francois, has been very active on 10 SSB on the weekends. Listen on 28574 KHz around 1500Z working 5 up. Also, FT5XH and FT5XA show up on 14165 KHz several mornings a week at 1100Z or later via long path. QSL for FT4XG via FD1ASS or F1ASS or to 1990 CBA.

USSR special event station. Ian, G3BWN has been given permission to operate a special event station in Moscow operating from May through 12. His call will be EK45WV/G3BWN. Ian will also operate as UA3/G3BWN from the home station of the local radio club president. The special event station will be operated by local war veterans and Ian. Ian was a radio operator during WW2 on the Russian convoys. The WV in the call stands for War Veterans. The special event will be on 20, 15 and 10 meters, both CW and SSB.

I'm on EEB's waiting list for an ICOM R-1. Today I received the
following letter in the mail:

Dear Customer,
      EEB has been informed  by ICOM that the new R1, R100, and R72A
have been removed from the market, until further notice.
      Unfortunately,  ICOM  is unable to project any future delivery
date at this time.
      We are suggesting that all orders be cancelled, but, will only
do so upon the customers  request.   Any  money already paid against
the purchase of one of  these  units  will  be refunded, in full, at
the time the order is cancelled.
      We apologize for any inconvenience.
      Please feel free to  call  our  customer service department at
1-800-368-3270 if you  should  have any questions or if we can be of
any further service to you.
      As always EEB thanks you for your business.
                                    Sincerely,
                                    Patricia Hurt
                                    Customer Service

OK folks, what's the deal?

I keep saying this, and I keep getting told that I don't understand etc. But somehow there is a feeling that if a frequency has been "assigned" it is being used. Most of the "assigned" repeaters etc on 70 cm in LA are not used. No, I don't call two co-owners who chat for 10 mins per week use. That is equipment testing.

Even on 2 meters, here in LA there are repeaters that are hardly used. Once myself and a friend were using 145.55 for chats. We found that there was a repeater near there. Yup, every Thursday at 19.00 the "Net" met there and played the Westlink tape. RF spectrum is a precious resource, we have to stop piddling it away.

In a recent posting, weir@husc8.UUCP (Robert Weir) writes:

> I have heard an interesting "numbers station" over the past 4 months or so and was wondering if anyone out on the NET might have any leads as to its location.

> The station is heard putting the carrier on about 2320-2330 each evening on 6841 kHz, simulcast on 5050 kHz. The YL, EE announcer goes through a few minutes of "1 2 3 4 5 6 7 8 9 0" before going into her 3/2 numbers routine. What makes me wonder is the incredible signal strength I receive here in Boston. IT ALMOST OVERLOADS MY RECIEVER WITH THE ANTENNA UNATTACHED! This station is not coming from Cuba, but most likely from someplace in the New England area.

This station is located on 6840 kHz, and its parallel on 5047 kHz. It's a classic computer generated 3/2 format English Numbers transmission which has been positively located on a National Communications System site in the Warrenton/Remington area of Virginia. This determination was made some years ago and has been detailed in several publications.

This station is heard at regular four hour intervals throughout the daylight hours with excellent signal strength throughout the northeastern United States. The earliest known interception has been at 1500 UTC, with additional loggings of this station at 1900 and 2300 UTC.

The format (as described in an article I published this month in The A*C*E Bulletin) follows:

Type Five Transmission Formats (3/2 English)

```
"361"                 (repeated three times)
"1234567890"
                      (This header, consisting of the identifier and the
                       count from 1-0 is repeated for a full five minutes).
 ----------           (10 electronic tones)
"Count xx"            (Repeated twice - corresponds to group count)
"xxx xx xxx xx . . .  (Cipher text or crypt)
"Repeat"
"Count xx"
"xxx xx xxx xx . . .  (As above)
"End"
```

You'll never find any 'sins of omission' with transmissions of this type. They are perfectly timed, well modulated, brisk and utterly bionic. While 5-D Spanish are often so technically inept as to be amusing, there isn't a single hair out of place with this group.

The cadence moves like this - 123.45..123.45..123.45.. where '.' equates
to a pause equivalent to the spacing between the numbers. So if you were
to pace it through, each group of 3/2 numbers when combined with its spaces
yields a count of 8 - one full 3/2 set with its spaces occupies an 8 second
block. [As published in The A*C*E Bulletin, a publication which focuses
on Pirate, Clandestine and Covert Radio, Numbers Stations and other similar
topics].

Another National Communications System site, located in Miami, was the
subject of a recent Popular Communications article about KKN-39 -
another of those stations we'd all like to know more about.

Best -
                /HM

I was told that there are patent infringment lawsuits pending on these
radios. I don't know if this is true or not, it's just what I heard.

Is there any digital use allowed on CB channels? I am think about
```

packet radio....not RC stuff for cars. And what channels can you use
for it?

Get a Radio Direction Finder......find where the signal is comming from.
Or just call the FCC....That is their job they should be able to find it.
I am now moving so I don't have my radio set up....so I can't see
if I get it in Hartford, CT.
I know there are other number stations that the FCC has tried to find
but there were not in the US....so they could not go after the people.

To quote from Telecom Cellular's (part of Telecom Corporation of New
Zealand, the still government owned but probably not for much longer
NZ-wide telephone company) brochure "All the facts about cellular phones
and how they work":

        How private is a call on a cellular phone?

           A cellular phone is virtually as secure as your normal phone.
        If you would normally have a scrambler, you should also use one
        with your cellular phone.
```

But of course people don't usually listen to a tapped wire "over a few beers", do they? There are a few people running around out there with scanners, and in NZ, a scanner that goes to 800MHz is expensive, but not vastly so; quite a few people have them. The radio regs in NZ make it a crime to act on or relay radiocommunications not intended for the listener, but it's an awful difficult thing to prove.

Given the ease with which an AM video signal can be interfered with, allocating one channel means that several channels are blocked within a given distance. Transmitters that are Co-channel, Adjacent Channel, Sound Image, Picture Image, Local Oscillator, If Beat, and Intermod (almost adjacent channels) (most assuming a 45 Mhz IF) have minimum seperation distances specified by the FCC.

Add on top of that two things. Repeater/Translators for poor reception areas, and the recent community low power TV activity (which is still up in the air, and hasn't come down yet), and the spectrum looks a little crowded. Not to mention the TV broadcasting is worth big $$$.

I don't know if this Sharp X68000 is an IBM pc clone, so the following may or may not be significant.

copied from Amateur radio packet:

```
 Msg# TSF  Size #Rd Date/Time MsgID        From   To
25681 BF   3274   0 0503/1054 13249_NA2B   N2IXL  VIRUS@NYNET ()
  Sb: Virus in Japanese Software

  ------------------------------
  RELAYED BY N2IXL, FROM BITNET (VIRUS-L DIGEST):
  From:    Yoshio Oyanagi <oyanagi@is.tsukuba.ac.jp>
 Subject: Virus found in Japanese game software (Sharp)
      VIRUS FOUND IN A JAPANESE GAME SOFTWARE ON THE MARKET
                            Yoshio Oyanagi
```

University of Tsukuba, Japan Newspapers reported on April 24 that a virus was found in a simulation game software "FAR SIDE MOON" (9500 yen) for Sharp personal computer X68000. It has been sold by Artdink Inc. since April 13 in Japan. The virus was detected by Computer Virus Institute (Takao Yamamoto, director) of Federation of Japanese Computer Clubs. According to Yamamoto, this virus is programmed so that it keeps inactive until July and after that data on floppy or in the computer will automatically be erased whenever one switches on the computer. So far 3000 sets have been sold, among which half are contaminated. It is conjectured that the computers in Artdink Inc. are invaded by the virus while developping the game software. Today (May 2) Asahi Shinbun (one of the major daily newspaper in Japan) disclosed that it succeeded in making contact with one of the virus makers. According to the report, the maker is a high school boy of age 17, who lives in Kagawa prefecture. Forty people collaborated in making the virus and got several tens of thousand yen (several hundred dollars) for each from the client, who ordered through PC network for hackers. The virus program was completed in three months and distributed secretly since last September. Federation of Japanese Computer Clubs told that there have been two viruses (viri?) for X68000, named "Namba I" and "Namba II". "Namba I" becomes active on July 4 this year and it deletes data on the computer or foppy disks. If the computer is contaminated with both "Namba I" and "Namba II", some X68000 do not accept any floppy after 0:00 May 2. The federation has developped a vaccine and distributing it among PC shops and users. If, however, a computer is contaminated with both viruses, it does not even accept the floppy disk of the vaccine. In this case, user should bring the computer to the maker and ask to change the parts.

In Message-ID: <1990May2.130539.3645@maverick.ksu.ksu.edu> Myron A. Calhoun writes:

<In a sample population of about 60 amateurs in this town, three of us
<own Kenwood TH-215A HT's, all purchased separately at different times
<from different sources....

<ALL THREE have developed an audio problem in the last eight months:
<the audio (both from the microphone and from the keypad) simply
<disappears at unpredictable intervals. And all three can be "fixed"
<by WHACKING the HT with the palm of one's hand--until it happens again.
....
<If your TH-215A has this problem, if you know of someone else whose
<HT has this problem, or if you know how to solve it, please let me know.
<One of these days a WHACK isn't going to work, and we need help!
<--Myron.

I have a TH-215A that had similar problems....and fixes. I don't know if I was also losing the keypad tones but the audio, both send and receive was dropping out as described. It first started out with losing the receive audio, then some time later I got some reports of no audio on transmit. I also experienced intermittent loss of power (everything off and nothing on the display). The fix was as described....a WHACK!

The first time I experienced the problem was when the rig was about a year old. I was able to fix it by re-soldering the connection on the jacks. I found cold solder joints on two of the three jacks (speaker and external mic). For some reason (maybe related to the large mounting holes on the PC board), the jacks appeared to be hand soldered......with large globs of solder. Everything else appeared to be machine soldered.

The next problem I had was with the power jack. The rig would intermittently just lose power. In some cases I could fix it with a whack and in other cases it required running a thin non-conductor into the jack and pushing on the wiper arm on the side of the jack. I later changed the jack. The new jack lasted about a year and has now been changed also.

About six to eight months ago I began having problems with the audio out again so I quit using the speaker mic until I could change the jack. I have now changed both audio jacks and am back on the speaker mic. I expect to continue getting this problem about once a year so when I ordered the parts from Kenwood I bought three of each jack. (Not a good solution but trying to be practical...and keep the rig going).

I think the coiled cord on the speaker mic subjects the jacks to too much tension so I now run the cord under the rig to relieve the tension on the jack. The molded double plug configuration of the speaker mic does not help the situation (causes a rotational moment and pressure on one jack). I think that the biggest problem with all three of these jacks is that they cannot withstand heavy/rough use.

I don't know how Dr. Calhoun or his friends use their rigs, but my problem has been mainly related to using it in my car. I don't think that anyone who strictly uses the rig on battery power and the internal speaker and mic would experience nearly as much problems as I have. However, I think that the problems would still occur to a lesser degree. The smart thing to do if the jacks are not used is to use the rubber jack-covers supplied with the rig. (Kenwood trying to tell us something?) This reduces the chances of contamination of the normally through contact on the jacks. (The suspected problem area is the normally through contacts on the jacks not making a good contact and being shocked back into contact when whacked).

It might be interesting to survey the number of people who have/have not experienced the problem and find out what percentage use the rig in their cars...with speaker mic, external power etc.

I have also heard of people having problems with the push-to-talk switch on this rig. It might be noted that the monitor switch (next to the PTT switch) uses the same switch and can be used as a replacement...if desired.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

* STS-35 NEWS *

Highlighting mission STS-35, the 36th flight of the Space Shuttle and 10th mission of orbiter Columbia, will be around-the-clock observations by the seven-member crew using the ultraviolet astronomy observatory (Astro) and the Broad Band X-Ray Telescope (BBXRT). Both instruments are located in Columbia's payload bay and will be operated during 12-hour shifts by the crew.

Liftoff of the 10th flight of Columbia is scheduled for 12:45 a.m. EDT on May 17 from launch pad 39-A at the Kennedy Space Center, Fla. Columbia will be placed into a 218 statute (190 nautical) mile circular orbit, inclined 28.5 degrees to the equator. Nominal mission duration is expected to be 8 days 19 hours 55 minutes. Deorbit is planned on orbit 139, with landing scheduled for 8:40 p.m. EDT on May 25 at Edwards Air Force Base, Calif.

Columbia's middeck will carry the Shuttle Amateur Radio Experiment (SAREX) to communicate with amateur radio stations within line-of-sight of the orbiter in voice mode or data mode. This experiment has previously flown on STS-9 and STS-51F. Also on this mission, Columbia will function as the subject for ground sensor operations as part of the Air Force Maui Optical Site (AMOS) calibration test.

Commander of the seven-member crew is Vance Brand. Pilot is Guy Gardner. STS-35 is Brand's fourth trip to space. He previously flew on the Apollo-Soyuz Test

Project mission in 1975. He also commanded Shuttle missions STS-5 in November 1982 and STS-41B in February 1984. Gardner previously piloted STS-27 in December 1988.

Mission Specialists are Mike Lounge, Jeffrey Hoffman and Robert Parker. Lounge previously flew on STS-51I in August 1985 and STS-26 in September 1988. Hoffman flew as a Mission Specialist on STS-51D in April 1985. Parker's previous spaceflight experience was STS-9 in November 1983.

Payload Specialists Ronald Parise and Samuel Durrance round out the STS-35 crew. Both are making their first space flights.

* STS-35 QUICK LOOK *

Launch Date: May 17, 1990
Launch Window: 12:45 a.m. - 3:09 a.m. EDT
Launch Site: Kennedy Space Center, Fla.
Launch Complex 39-A
Orbiter: Columbia (OV-102)
Altitude: 218 statute miles (190 nm)
Inclination: 28.45
Duration: 8 days, 19 hours, 55 minutes
Landing Date/Time: May 25, 1990, 8:40 p.m. EDT

Primary Landing Site:
Edwards Air Force Base, Calif.

Abort Landing Sites:
Return to Launch Site -- Kennedy Space Center, Fla.
Trans-Atlantic Abort -- Banjul, The Gambia
Abort Once Around -- Edwards AFB, Calif.

Crew:
Vance D. Brand -- Commander Red/Blue Team
Guy S. Gardner -- Pilot -- Red Team
Jeffrey A. Hoffman -- Mission Specialist 1/EV -- Blue Team
John M. "Mike" Lounge -- Mission Specialist 2/EV2 -- Blue Team
Robert A.R. Parker -- Mission Specialist 3 -- Red Team
Samuel T. Durrance -- Payload Specialist 1 -- Blue Team
Ronald A. Parise -- Payload Specialist 2 -- Red Team

Red Team shift is approximately 10:30 p.m. -- 10:30 a.m. EDT
Blue Team shift is approximately 10:30 a.m. -- 10:30 p.m. EDT

Cargo Bay Payloads:
Ultraviolet Astronomy Telescope (Astro)
Broad Band X-Ray Telescope (BBXRT)

Middeck Payloads:
 Air Force Maui Optical Site (AMOS)
 Shuttle Amateur Radio Experiment (SAREX)

SHUTTLE AMATEUR RADIO EXPERIMENT (SAREX)

Conducting shortwave radio transmissions between ground-based amateur radio operators and a Shuttle-based amateur radio operator is the basis for the Shuttle Amateur Radio Experiment (SAREX).

SAREX communicates with amateur stations in line-of-sight of the orbiter in one of four transmission modes: voice, slow scan television (SSTV), data or (uplink only) fast scan television (FSTV).

The voice mode is operated in the attended mode while SSTV, data or FSTV can be operated in either attended or unattended modes.

During the mission, SAREX will be operated by Payload Specialist Ron Parise, a licensed operator (WA4SIR), during periods when he is not scheduled for orbiter or other payload activities. At least four transmissions will be made to test each transmission mode.

Ronald A. Parise, 38, also will serve as a Payload Specialist. Parise is a senior scientist in the Space Observatories Department, Computer Science Corporation in Silver Spring, Md. He is a member of the research team for the Ultraviolet Imaging Telescope, one of the instruments scheduled for flight as part of the Astro payload. He is from Warren, Ohio.

Parise has participated in flight hardware development, electronic system design and mission planning activities for the Ultraviolet Imaging Telescope project. He is pursuing his astronomical research interests with the International Ultraviolet Explorer satellite under a NASA grant.

He received a bachelor of science degree in physics, with minors in mathematics, astronomy and geology from Youngstown State University, Ohio, and a master of science degree and a doctor of philosophy degree in astronomy from the University of Florida.

The primary pair of frequencies intended for use during the mission is 145.55 MHz as the downlink from Columbia, with 144.95 MHz as the uplink. A spacing of 600 KHz was deliberately chosen for this primary pair to accommodate those whose split frequency capability is limited to the customary repeater offset.

SAREX crew-tended operating times will be dictated by the time of launch. As a secondary payload, SAREX will be operated by Parise during his pre- and post-sleep activities each day. This means that wherever the Shuttle is above Earth during those operating windows, amateur stations can communicate with Columbia. Currently, those windows provide coverage for Australia, Japan, South America and South Africa.

The continental United States has little or no coverage except through a network of ground stations in other parts of the world in conjunction with relay links back to the United States.

Another part of the SAREX is the "robot," providing an automated operation which can proceed with little human intervention. The robot will generally be activated during one of the crew-tended windows and deactivated during the next one. This gives approximately 12 hours on and 12 hours off for the robot, with the operational period chosen to cover all of the U.S. passes.

SAREX has previously flown on missions STS-9 and STS-51F in different configurations, including the following hardware: a low-power hand-held FM transceiver, a spare battery set, an interface (I/F) module, a headset assembly, an equipment assembly cabinet, a television camera and monitor, a payload general support computer (PGSC) and an antenna which will be mounted in a forward flight window with a fast scan television (FSTV) module added to the assembly.

Antenna location does not affect communications and therefore does not require a specific orbiter attitude for operations. The equipment is stowed in one middeck locker.

SAREX is a joint effort of NASA and the American Radio Relay League (ARRL)/Amateur Radio Satellite Corporation (AMSAT).

STS-35 COLUMBIA SAREX FREQUENCIES

	Shuttle Transmit Frequency	Accompanying Shuttle Receive Frequencies
Group 1	145.55 MHz	144.95 MHz
	145.55	144.91
	145.55	144.97

Group 2	145.51	144.91
	145.51	144.93
	145.51	144.99
Group 3	145.59	144.99
	145.59	144.95
Group 4	145.55	144.95
	145.55	144.70
	145.55	144.75
	145.55	144.80
	145.55	144.85

Note: The 145.55/144.95 combination is in both Groups 1 and 4 because alternate uplink frequencies from Group 1 would be used over North and South America while those from Group 4 would be used generally in other parts of the world.

The MFJ 1278 8 level grayscale fax capability isn't terribly well documented (for that matter, even the 4 level docs are lousy). Here's some info for those of you who want to implement software:

1. Sync detect. At the beginning of a transmission, fax stations send about

20 lines of black ('o') with sync bars ('0'). The sync bars are roughly 14 characters (28 pixels) wide; I sync on the middle of the sync bars.

2. As one would expect, data is packed two pixels per byte, offset by 48d.

3. Assuming that you include the sync bars in the picture, the frame format is 607x1200 for WEFAX. Unfortunately, the clocking is a bit off, and you need to cut off one pixel at the end of every other line (eg, they're really sampling at a rate of 1215 pixels per second). The images are actually 600x600, so you need to compress the y-axis by a factor of 2.

4. Your software must be capable of an average throughput of 6kbps if you can do xon/xoff flow control, or minimum 6kbps without flow control. MacKermit, for example, can keep up, but only if you have xon-xoff flow control set.

5. The results are well worth it. I have some sat pix that I've downloaded and converted to GIF using pbmplus and some simple routines I've written; the quality is far better than commercial wxfax marine units. It works suprisingly well even in a fading environment.

>This year I remembered to carry a pedometer. I spent all of Friday
>and Saturday at the Hamvention, and did the Air Force Museum on
>Sunday. The weekend total hike was 18.2 mi.
>

I had a great time. The exhibits were first class. I spoke to several designers from Cushcraft and Hygain. This was very useful since I have antennas from each and had some questions. Also, every linear manufacture except was Henry (boo) was there with the top off so you could see the innards. Great to compare band switches, coils, cooling, plate chokes, etc. No unanswered questions!

The DSP stuff from PAC COM and AEA went over like a lead baloon to the masses. No surprise there.

The flea market was real interesting. Some real good buys if YOU KNEW WHAT YOU WERE LOOKING FOR. A great job by the sponsors. Thanks to them for a super HamVention.

PS. I walked my self to death, If you plan to go next year do some walking to get ready!

bye...

Well first of all 47 Degrees is not all that far North. It is about the same latitude as Nantes France. It is south of London, Berlin, Copenhagen, Warsaw, Den Hague (That's enough dreary capitals -Ed). But the question I suppose should really be, how far North is it from the "Magnetic Equator." I dimly recall that a stations position relative to the magnetic equator is important vis-a-vis Aurora and HF propagation.

But first, lets assume that Marquette is in Aurora Country and is also sitting on top of a fair amount of iron ore. There is a similar location in Sweden. The world's "largest city" (in square kilometers of desolate Tundra) is Kiruna. It is also an enormous iron mine. Hams there should experience the same phenomenon as Gary.

I remember in the seventies hearing a second hand story that DX was pretty bad off the Southern Tip of Sweden (Ystad, Trelleborg) because there were massive Iron deposits just offshore. The story involved not getting out and not hearing too well. Southern Sweden does get a few Auroras also.

No good answers I'm afraid, but certainly some points of reference and comparison. All we need now is a report from Kiruna.

Note: Marquette is about 47 degs North, Helsinki - 60 degs North and Kiruna - 68 degs North.

I'm favorably impressed by his apology. I hope he reads this.

> subscribe to his views. I believe that ARF is damaging to amateur radio
> as antisemitism is encouraged even if he himself is not antisemitic as
> he says below. He is not, as he says, responsible for the views held
> by others. He is responsible for giving them a forum to unleash THEIR
> `hate mongering.'  I do not know how many of you are aware of the `audio'

There is the legal principle of the 'attractive nuisance', but I'll let it ride. I agree that one of the gravest threats to ham radio today is the reflection of the general societal mania for running one's individual rights into the ground to the point that society at large suffers.

Each period in history acquires it's own nickname. The Victorian period, the Edwardian, the Flapper, the Baby Boom, etc. This, I fear, will be the "Me first; f*** you!" Age. Too bad. Among other things it's going to kill off a nice hobby if we're not careful.

I strongly recommend the program sold by the ARRL and advertised in QST. It is written by (and also sold by) GGTE. It has the best simulated QSO's of any program I've seen. It does excellent randomization of names, QTHs, occupations, etc.   After using it nightly for a couple of months, it was still coming up with stuff I hadn't heard before. It does Farsnworth spacing. I've considered using it to generate tapes for VE exams.

QSL AH3C via K9UIY. If you worked him as AH3C/KH5J, qsl via
OH2BN. SASE required. (The /KH5J group worked 52,000 QSOs!
How'd you like to pay for 52,000 stamps? or fill out 52,000
cards. Ugh.) BTW, rumor is that they are applying to make
Jarvis a new DXCC country, separate from Palmyra Is. Nice if
you have both, like me.

> Once again I have decided to improve my CW skills. This time intend to succeed and to help I would like to get a good PC training program. I have alredy looked at some and none of them do what I would like. I would really like a program whereby I can send individual characters at 20 WPM but spaced at some slower speed. This is how I got to 13 WPM by listening to the sound of the character, and then increasing the effective WPM. If anybody knows of such a programe please let me know.
> Thanks and 73's
>
> Geoff Williams

Geoff:

I believe SuperMorse will do just what you've asked for. It as individual settings for CHARACTER SPEED, WORD SPEED, and SENDING SPEED, to that you are in effect adjusting the inter-character and inter-word speeds.

I have used it with classes and to make tapes for individuals and code tests.

The latest version that I know of is 3.09 and it has built in training for new code learners, will send from disk files or the keyboard, will generate random groups or words from a word list, or generate exams.

You can obtain the (shareware) SuperMorse from a number of sources. It is on CompuServe, SimTel20, and many BBS systems around the country. I can send you a copy for trade of a blank diskette, or you can write to the developer directly.

The developer is:
WD5CID, Lee Murrah, 10 Cottage Grove Woods, S.E., Cedar Rapids, IA 52403
*** NOTE: his - suggested Shareware contribution is $15 ***

Congratulations to our very own Trey Garlough, WN4KKN/5, for his first-place finish in last November's ARRL CW Sweepstakes contest.

I see that W5EHM--including netperson Derek Wills, AA5BT--brought home the 10th-place spot for multiop in the Phone contest.

Did I overlook any other netfolks in the Top Ten listings??

I am trying to make a control program work on the R9000. I'm adapting an existing R7000 program that works fine. Everything is working except the read/load memory channels operation. On the R7000, to load a memory you, select the memory, set the freq, set the mode, do a loadmemory command. To read a memory, you select the memory, read the freq, read the mode. On the R9000, only the selection of the channel seems to work. Nothing else is.

Info from ICOM is very sketchy and incomplete. If you know what I need to do or have any ideas, I'd appreciate email.

The shuttle astronaut INTERCOM headsets ALSO transmit on 279.0 (except during military flights, when they use IR links instead) and have been heard before during flight by listeners on the ground. That is likely what was heard this time, as the astronauts did not exit the airlock, and I'd not expect the suit transmitters to get out of the sealed air lock very well at all...

Not quite EVERY manufacturer. I was disappointed that Advanced Radio
Devices (ARD 230A) did not show up this year. If you were at dayton
last year, you saw what a REAL amplifier looks like.

ARD was considering building an automatic antenna tuner which I was
hoping to see there. I also noticed that ARD is no longer listed
in the latest AES catalog. Perhaps they are too busy with commercial
work to spend much time on amateur radio products. This would be
a pity since their amplifiers are clearly head and shoulders above
any other amplifier on the amateur market today.

Heath was there...They had a very nifty antenna rotor control
box with a computer interface. Type in the prefix and/or country,
and the rotor goes there. No need to look up beam headings on a
paper chart.

I (finally!) have an amateur radio callbook server online, available via email. This server is still in the testing phase, so please let me know of any problems. There is no FTP access to the server, but there are other sites providing that. Currently, the only search key is the callsign. If there's enough interest, I may add other search criteria later.

Here is a copy of the help file:

The callbook server is accessed by sending mail to callbook@sat.datapoint.com. Include the following line in the body of your message:

```
     lookup <callsign> [<callsign> ...]
```

The maximum length of a lookup command line is about 200 characters. You may specify more than one lookup command if needed.

The following commands are also recognized:

```
     help - return this help text.
     quit - quit scanning for commands.
```

Quit is not needed, but may be used if you have a signature that contains things that look like callbook commands.

The callbook data is taken from FCC records as of September 1989, as provided by Rusty Carruth, N7IKQ.

If you have any questions, send mail to callbook-help@sat.datapoint.com.

Thanks,
Lee Ziegenhals, N5LYT

I had a thought (watch out). Anyone interested in tying some repeaters together for a chat using autopatch to autopatch?

I think it would be a kick to chew the fat coast to coast FM mobile. You know, reach out and touch (careful) someone. Interstate costs are quite inexpensive at 60% off prime on weekends. Say a Saturday afternoon or evening. Our 220 repeater club in Sandy Eggo would like to give it a try if there are any takers.

Just think, if someone has conference calling on their repeater line, then we could get 3 boxes connected. Think about it, talk it up, see if you can get your members to check in at the annointed time. The more hams listening at both ends of the line, the better. The "San Diego Los Angeles Intertie Club" (SLIC) will start the ball rolling at initiate the calls, so NO cost to your club if you'd like to participate.

We can be found at 224.16 Mhz, PL 1B, San Dgo County, Cuyamaca Peak, 5900 feet, Coverage into Organge County if you care to chat on our system about the idea. Any comments, suggestions (positive only please), or input is solicited.
                Mike, WB6WUI
btw--sorry 'bout the garbage/distortions...

When you mention a magazine (especially somewhat obscure ones), please try
to include an address or phone number so we can follow-up.

In an earlier posting, I mentioned that _VHF_Communications_ (a translation
of a German technical Ham magazine) was available from "Timekit".  I am still
waiting for a copy of the magazine, but here is the address and phone:
```

Timekit
P.O. Box 22277
Cleveland, OH 44122
(216) 464-3820

As far as I can tell, this phone number is the home phone of Mr. Fred R. Sharp, who is semi-retired and runs Timekit from his home (so be considerate when choosing a time to call). He apparently also sells Ham radio kit projects as well. _VHF_Communications_ is published four times per year, and costs $20.95 per year. I will report back to this group after I see a copy.

In my early years I'd see neat crystal radios made with "Cat's Wiskers". These devices were sets of mounted crystals and a probe to find a good spot on the crystal for radio reception. I'd like to make one. Can anyone tell me where I can get a set?

Thanks in advance,

David Shine

I just started playing around with HF packet on 28.109 mhz. It is really quite a lot of fun. It took me a couple of days to finally get my radio and PK-232 set up properly. I was using the squelch line from my IC-725 to the PK-232. By using the squelch line I was losing some of the marginal signals. After removing that line things worked much beter.

Anyway...what I would like to know are the rules of etiquette, if any.

Ha! You guys may be in luck, since I fixed mine -- I have the service manual and decided to jump in (I had upgraded the software and you have to pull the unit completely open to do it --). Anyway, I was using the rig one day and the next -- no audio -- just a slight noise that appeared to be white noise from the final audio buffer. When plugging in the speaker mike -- same problem. Touch the TTPAD and get your ears blown away -- I think beep also worked. Kenwood had no knowledge of previous problems.

I had to rig up a jumper ribbon cable so I could lay the rig out for testing and immediately checked the input audio to the volume control. No problem -- but there was nothing coming out the other side. I jumpered the pot (i.e. simulate pot max volume) and my ears were hurting. Upon removal of the pot I found a crack on the ALPS pc board that has the leads mounted to it. Apparently, I must have hit the volume control pot the previous day and cracked the pot trace (again this trace was part of the pot not the rig pcb). I had noticed when I disassembled the unit that there was no nut on the pot to hold it in place (none on the squelch either). The volume pot is right at the edge of the unit and is most likely knob to get hit.

When parts arrived, it came with a nut so I installed it to help prevent this problem in the future -- no problems since. (I failed to mention that I shorted out the power lead to ground and blew a diode in the power ciruit. It was obvious which one. -- so be careful!)

I think the switched volume pot cost $4.95 + $3.00 shipping.
(the diode looked like a fused type so I ordered that too for $1.95. The one they sent me was a normal silicon power diode so I don't have to guess anymore. I also picked up a set of backcase screws -- very small heads but very long screws to replace my old ones -$.05 - Make sure you have a "good" screwdriver that really fits.)

All these problems sound like the same thing. I have never had any problems with my rig, and I bought one of the first ones out. (Hence, the software update to give me the ability to lock out memory channels during scan.)

Hope this helps.

"As long as you don't act on the basis of what you hear, you are breaking no laws." Now let me tell you the reality...

I have a close friend here locally (N...) who is the proud new owner of a R9000. After a good deal of urging, he persuaded me to join him for a few beers and listen to the 9000. So up to 800MHz we went, and in a half hour I got...

- a dope deal being set up;
- a replay of last night's sex scene between Mr. X and his secretary, together with how X was planning on getting away from the wife and kids again tonight;
- several discussions of corporate takeover strategies (this is Silicon Valley);

  - etc.

It was hilarious, just as my friend promised me. (But not entertaining enough that I would even think of plunking down $4K+ for a 9000 of my own.) Apparently there are a lot of salesmen out there claiming cellular calls can't be monitored. Worse, there are a lot of people who believe it!

I am looking for a program that will support the sending and receiving of slow-scan images using an Amiga computer. It seems that something that supports sending directly from an IFF should be fairly simple to do. I'd like to hear what anyone else has on this.

Copying by typewriter or computer keyboard *IS* copying by hand !!

What is NOT copying by hand is letting any mechanical, electrical or algorithmic device do it for you.

If the VE's refuse to allow copying by hand in its various forms, contact the VEC and ask for this to be corrected and a makeup exam session to be scheduled. If the VEC refuses, get another VEC to do some exams in your area.

HR Magazine USED TO BE a less fancy magazine. I must say I have enjoyed the art work that has been done on the covers. But I believe HR could have been operating much leaner. I remember when the covers were simply 2 color and the whole magazine was smaller. I guess I will need to start reading some other technical magazines. The lack of publicity about them has been the major reason I have not been getting them. I will now be collecting info about the various ham radio publications in a file, and once it is reasonable enough, will post it. If you e-mail or post info you know, please make

sure the info is complete and correct. If you have not verified the rates
for subscription within 6 months, please do so.

A local ham here, WB9JSO, has the same radio and the same problem.
Sounds like an epidemic to me.

> But when I called Kenwood's Service Department yesterday, I was told
> "We've NEVER HEARD of such a problem before.... Just send it in when
> it happens again and we'll service it for you...."

They tell lies.

> Of course, when UPS "plops" the box onto their counter, the problem

That's what makes intermittent problems so great.

> HT has this problem, or if you know how to solve it, please let me know.
> One of these days a WHACK isn't going to work, and we need help!

Exploratory surgery might be in order.

I once had a spurious bug in a major IBM mainframe operating system, and
IBM claimed it could not possibly do what I said it was doing. I looked
at the source and found it, but they still denied it was a bug. I fixed
it and sent them the fix. Two releases later, my code was in it.

> has before the WARC a proposal to convert all between 1000 and 3000 Mhz to
> Land Mobile. We had better get our act together and fast.

I recently had a conversation with a local ham, not over the air, concerning
the density of amateur FM/repeater communications in large metropolitan areas.
He had spoken with another ham from such an area who had the perspective that
in his area (LA) the 2m, 1.25m, 70cm, and even the 23cm were FULL. He had
the perspective that 1 QSO per day made the repeaters "busy".

If you want to see what ***FULL*** is really like, take a look at the
Land Mobile spectrum. LM needs spectrum, they need it badly, and they

need it NOW! Compared to LM usage, 2 meters is a barren wasteland!

We are going lose LOTS and LOTS of spectrum to Land Mobile and other interests (HDTV perhaps) if we don't get our act together and DO IT NOW! We need to CUT THE BS and make our bands MUCH MUCH more used than they are now.

Back to the subject. The HF spectrum is being highly ABUSED, but most of it is reasonably crowded now. Here is your chance to help reduce the problem. QSY from 20 to 2 or 220. Let's start getting more hams we have now to actually USE the VHF and UHF spectrum. If you tune across all the repeaters and find LESS THAN 80% in use, then the band is WIDE OPEN for you to use. GO FOR IT!

The ARRL doesn't have any authority to do anything about the HF problems. They can ask for more "gentlemen's agreements", but what is really needed is some regulatory and enforcement teeth. The FCC is not going to do this for us, so we need to find ways to do it ourselves.

If we don't act, then SOMEDAY, ham radio will be totally gone, and what use remains of the radio spectrum will be CB and outlaw.

If you are one of those people who claim that ANY VHF or UHF band ANYWHERE is full or crowded or too tight for a QUADrupling of usage, then BURN YOUR TICKET AND GET OFF THE AIR.

It may or may not be illegal, but I KNOW it is definately possible. While working on a radar detection and classifaction system at a local defense contractor, we were doing some chamber testing in the lab. As these tests take hours, we decided to amuse ourselves. HP makes a nice little spectrum analyzer (I forget the part number) that contains built-in AM/FM demodulators. We just stuck an antenna into the input port (a bent paper clip worked the best of all antennas we tried) and we could tune into any signal in the band of interest. In this case, the band of interest was the cellular phone band. We could pick any channel in the band we wanted, hit 'peak find' to center the demodulator, and then turn on the audio. Quite fun for about 1 hour. We noticed that most calls are for real-estate deals taking place and guys trying to impress their girlfriends. One guy was calling his woman while sitting in her driveway. If you want to make it private, DONT'T do it on cellular.

Well I have not lost the volume on my Kenwood radio yet. (knock on wood) I have the 220Mhz Kenwood TH-315A and it has been working fine up until tonight. When I unplugged the unit from the wiring harness that I have rigged up in my truck, the radio "locked up". I couldn't change channels or get and audio out of the the thing. The unit was still displaying the repeater frequency that I was just listening to and the S-meter was on full scale even though I had not plugged the rubber duck into the unit yet. Turning the unit off an on a few times, the HT seemed to reset itself including erasing all of the memories.

Just wondering if anyone else has had this problem with their rigs?

Everyone keeps overlooking the geology of Michigan's UP, much of which is
RICH in copper and iron deposits. We're speaking in terms of the whole
dadgummed peninsula being being  one humongous bar magnet.

```

In the late 50's, I built one of these cut for 10 meters. (10 was used a lot like VHF by locals back then.) It really worked like a champ. The nice thing about the J-pole from a safety pint of view when tower mounted is that it can be grounded at the bottom, eliminating the need for lightning arrestors.

The "by hand" business only replies to SENDING, not receiving. Besides, how many people do you know who type by their toes or nose? Most folks type by hand anyway.

>know exactly what the laws say.

Thanks to intense lobbying by the cellular phone industry, a law was passed
making it illegal to sell equipment capable of receiving cell phone calls or
to listen to such calls. The implication of the former is that scanners sold
new have the cell frequencies blocked, usually by the installation of a diode
which most people easily find out how to remove. The fact that the latter is
in direct conflict with the Radio Act doesn't seem to bother the lawmakers.
The end result is that it is both possible and illegal to listen to cell phone
calls.

This subject has been discussed at great length in the moderated
comp.dcom.telecom group. That's the best place to go for detailed, specific
info on this topic.

I stopped subscribing and reading CQ a while ago because I'm not now nor
ever plan to be a "big gun" DXer. Now that Ham Radio is gone and QST has
cut back, I guess the writting is on the wall. Anybody who thought we
weren't a country of "appliance operators" will get a clear message now.

I wonder if I can get subscriptions to some of the European rags over here??

At the Dayton Hamvention it was announced that Ham Radio Magazine had been sold to CQ. The June issue of HR will be the last.

My friend had a similar problem with his ICOM 228H,
a trip to ICOM didn't solve the problem.
He eventually found a lose connecter. After removal and reinsertion,
the radio now works fine.

Could some kind soul out there in net-land please forward any and all experiences with receivers from AOR and ICOM. I'm interested in a very broad band receiver (say ~50khz through >1Ghz) with continuous band coverage in 50khz or less steps. Costs should be reasonable!!!

Some of the items of interest are the sensitivity of the unit versus frequency and the guaranteed frequency max (some unit's specs are only stated for a portion of the entire spectrum and have limits well inside the max freq the recevier is capable of tuning).

Thank you in advance for your help and patience...

My interest in DSP began with WB2TNL over two years ago. Then more recently with Brooks. I am a real fan of DSP and hope it takes off like a rocket. Speaking of rockets you missed a good one at McNastys. I had the pleasure of sitting next to MOV and across from Brooks and IWI.

Anyhow, my impression was that people who already had some knowledge of DSP were real excited. Those who saw it for the first time could not quite figure out what it was. Maybe some education in the form of articles in mass circulation magazines. Ham Radio just did one, but it propably isnt read widely enought.

Also, "like a lead baloon" may be too harsh. With all due respect
to those like yourself who have done MUCH work on the subject new
things take time to develop. I am sure that DSP will be a real hit
once it is in the market place and its benefit over a TNC is known.

Keep up the good work DR. BOB. I for one appreciate it.

If a $300 box can decode it, it wouldn't cost much more to build an
encypherment unit that will bury the characters so deep that no one
can decode them, especially at 5 to 10 characters per second.
In several years of messing around, I've discovered that if the signal
has a wide shift (850 Hz?), that I'll have little or no chance of printing
anything. These are probably military.

After looking at the scope outputs of my '232, I don't trust the linearity of the automatic level control in the filters at all. Overdriving the input will add all sorts of spurious crud, and the same can be said for the audio section of the receiver. I use a Kenwood R-1000 and tap across the audio output with an transformer, cranking down the volume control to the minimum level that gives good copy. The audio transformer (8 to 500 ohm) steps up the voltage so that the audio amp in the receiver is operating at a low level.

|
|It was hilarious, just as my friend promised me. (But not entertaining enough
|that I would even think of plunking down $4K+ for a 9000 of my own.)

You don't need to spend $4k for an 800 MHz receiver. The Bearcat (Uniden) 200XLT portable picks up all the cellular frequencies offset 21.7? MHz higher (something to do with a harmonic and the way a superhet receiver works). Retails for $250. If you want them to be at the correct place, there is a modification (adding or removing a resistor) that unlocks the cellular band (only the American ones are locked out because of the Electronic Privacy Act, the foreign ones are made with the frequencies accessable). In addition to the cellular band, you get 200 channel programming in 10 bands and coverage of just about all Fire/Police/Emergency/Weather/cordless phone/CIA/FBI/etc.. frequencies, all in a portable with a rechargeable battery.

ZCZC AP21
PROPAGATION FORECAST BULLETIN 17 ARLP017
FROM ED TILTON, W1HDQ
SPRING HILL FL APRIL 23, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX TREND HAS BEEN DOWNWARD SINCE THE MIDDLE OF JUNE 1989, WHEN IT PEAKED AT 327. SEPTEMBER HAD FIVE DAYS OVER 300, BUT NONE HIGHER THAN 305. IT WAS THOUGHT THAT HIGHER READINGS MIGHT COME IN 1990, BUT THE FLUX HIGH OF THE YEAR SO FAR IS ONLY 265, AND THAT CAME BACK IN JANUARY. THE NEXT BEST MONTHLY HIGH, 249, CAME ON APRIL 20. A SUDDEN OUTBURST OF HIGHER FLUX LEVELS CANNOT BE RULED OUT YET, BUT CONSISTANTLY MUCH LOWER FLUX FIGURES IN 1990 SO FAR MAKE THIS A REMOTE CHANCE.

THE FLUX MADE A DRAMATIC CLIMB BEGINNING ON APRIL 9, BUT THE BEHAVIOR OF THE EARTHS MAGNETIC FIELD WAS A MORE INTERESTING BUT

FRUSTRATING ASPECT OF THE MONTHS PROPATGATION THUS FAR. THE FLUX ROSE FROM 144 UP TO 249 IN ONLY 11 DAYS, BUT WHAT HAPPENED ALONG THE WAY IS OF GREATER INTEREST. ON THE 9TH, THE K INDEX ROSE FROM TWO TO FIVE. OVER THE NEXT SIX DAYS IT WAS NEVER BELOW THREE, AND MUCH OF THE TIME IT WAS SIX OR SEVEN. SUCH FIGURES MADE FOR ALMOST NO USEFUL PROPAGATION ON HIGH LATITUDE PATHS FOR THE BETTER PART OF A WEEK, EVEN AT THE AUTHORS FLORIDA LOCATION.

THINGS STARTED TO IMPROVE AFTER THE 20TH, BUT REALLY GOOD SIGNALS FROM PLACES LIKE NORTHERN EUROPE ARE STILL RARE. THE SOLAR FLUX IS HEADED DOWNWARD AGAIN, SO THE REST OF APRIL SHOULD BE BETTER FOR HIGH LATITUDE PROPAGATION.

AMERICAN SUNSPOT NUMBERS FOR APRIL 12 THROUGH 18 WERE BETWEEN 88 AND 226 WITH A MEAN OF 159.4. AR

HAM RADIO HISTORY

4 Billion BC - Earth is a swirling ball of flaming gases. Propagation is extremely poor.

1 Billion BC - First dry land appears. It is divided up into squares.

County Hunters Club formed.

500 Million BC - Second patch of dry land appears. First DXpedition. Credit disallowed because of questionable licensing agreement.

400 Million BC - Flowering plants and grasses evolve. Telrex invents first beam antenna but sales area slow because of lack of suitable structures.

300 Million BC - First tree appears. It is immediately cut down, stripped of branches, placed in a concrete base and named a telephone pole. Telrex sells first beam.

200 Million BC - Second beam sold by Telrex. Installer falls from top of pole. First safety belt sold.

100 Million BC - First mountain appears. Repeater invented.

50 Million BC - It is decided by WARC that "seek you" is too cumbersome to send on CW, so abbreviation "CQ" is adopted.

4 Million BC - Humans replace swine as dominant species. The name "Ham Operator" hangs on, however.

3 Million BC - Dugout canoe invented. Maritime Mobile Net formed on 14.313 mHz.

2 Million BC to 800 AD - Nothing much happens for a long time.

900 AD - Chinese invent gunpowder. BY1AA is first "Big Gun" DXer.

1790 AD - Ben Franklin invents long wire receiving antenna. Ground switch invented.

1961 AD - Second repeater erected. First repeater group refuses to change frequency. First frequency coordinator appointed.

1990 AD - Amateur radio humor sinks to a new low.

.....

On The Subject of QSLing

I would like to present a few points from my side with the hope that the message might get across to those who want so badly to get a QSL from my part of Canada and which can also apply to many other stations

in many parts of the world.
{
- I QSL via the bureau when I receive your card and as this is a hobby it may take some time to fill out cards. I also wait until I have enough card ready to make sending them to the bureau worth while.

- I only QSL direct if I am especially interested in receiving your card, I send you an IRC or green stamp, when we have agreed to it in the QSO, when you want my card and send me an IRC or green stamp.

- If you QSL direct without my agreeing to the same and do not send an IRC or green stamp, I will send you a QSL via the bureau.

My reasons for handling QSLs this way is simple and something we should all consider. Ham radio is not (fortunately) only a rich man's (woman's) hobby. I for one am far from being rich and what little money I can spare for the hobby is better put to equipment and keeping the station in operation. At the postal rates in Canada, almost $0.50 to the US and $1.00 to Europe, I could spend $50.00 plus each month when I am active. I can not afford this expense!

US amateurs are the worst on my list for sending QSLs direct with the assumption that I will automatically QSL direct with them. For this reason I (and others) restrict my operations in the US portions of the bands. The QSL issue becomes a big hassle. Explaining my rules for QSLing at times brings nasty comments. Nothing personal, but I need very few US QSL cards. I have a drawer full of them. I can work most parts of the states any time of the day.

After many years of being on the air I no longer have the same interest in collecting cards that others may have. I have a large collection of QSLs from all over the world. In most cases others may want my card much worse then I want theirs. I would be pleased to QSL with anyone who will follow the simple rules, which I feel are basic courtesy to other stations.

This article, and the next one, describe some pretty classic auroral sky-wave effects. The last episode you mention came during a minor storm period. The time of night (strongest when the sun is directly opposite you) is auroral oval stuff all the way. If you can get anyone who studies geomagnetism interested, you could try correlating your data with stuff like aa indices, substorms, bays etc etc.

The ground-wave effects are outside my expertise. All I can suggest is to grab an FAA aeronautical chart and see if any magnetic anomalies are noted for your area.

There's a place in Santa Monica, CA where posts move by themselves and KXLU suddenly goes away (despite being in the 100 dB contour). Local mysteries are great fun.

I think that in this particular case the radiation is being supported by the cable system. The same tv with rabbit ears causes no interference. I have added a high pass filter and a 6db attenuator at the tv and another high pass filter at the wall outlet for the cable along with a dc blocking device. This reduced the interference all the way down to extremely annoying.

I suspect that the energy is coupled into the cable rather than being carried by the coax shield (that's what the dc blocker was for - it simply introduces a small break in the shield). The cable company, of course, denies that the problem could be in their system.

73's - Steve WA5RPF

Subject: Autopatch in Maryland.

Hmmm, I MUST have missed something in the original request. The person asked what are the local repeaters in Maryland operating on any band - i.e., 10M, 2M, 220MHz, 440MHz and the GHz areas. Simple question. Granted that he SHOULD purchase a repeater directory, but what if he doesn't know where to get one, or who to ask ? Is he newly licensed? Did he just purchase his radio, and would like to get on the air, so he could join a local club, and use the repeaters patch?

Where does he say he is trying to bypass the local phone company? Why does anyone use a patch? I rarely use one, and in the last several months, I have only made a single patch home - but it is there just in case.

Face it, 89.234% of all patches could be made by stopping at the phone booth, but we don't.

If I had a repeater guide, I would gladly e-mail the info he requests (oops, is that a copyright problem --- scratch that, it would just cause another 2 months worth of flames).

Replies of the like make me afraid of asking questions, in fear of being labled stupid, or it doesn't belong here, etc.

LIGHTEN UP, WOULD YA!!!

This device is an all-pass network with constant phase shift throughout the speech spectrum.

See _QST_ January 1988, p. 16: "A New Breed of Receiver" by Gary A. Breed, K9AY (who, incidentally, is the editor of _RF Design_ magazine). This article contains the schematic for an active 90-degree audio phase-shift network using 8 operational amplifiers. The article also contains an excellent explanation of how the phasing method eliminates one sideband.

The advantages of the phasing method is that it requires no expensive RF SSB filter, and is frequency agile. A properly-aligned phasing-type transmitter is said to have better audio quality because there is no ringing from a sideband filter.

Disadvantages: The phasing method requires _two _ balanced modulators, and phase-shift networks for both audio and RF. It has a higher parts-count, and is more difficult to align. Perhaps it will become more popular with the advent of inexpensive Direct Digital Synthesizers (DDS) which can easily produce quadrature RF.

Having complained about sanitation at the Dayton Hamvention in the past, I must say that this year they appeared to have made a major and successful effort to remove trash and maintain the portable outhouses. All in all, I had a fine time in Dayton. Thanks, DARA!

This year I remembered to carry a pedometer. I spent all of Friday and Saturday at the Hamvention, and did the Air Force Museum on Sunday. The weekend total hike was 18.2 mi.

BTW, the AF Museum's newly-acquired SR-71 will be on display in June.
(They have had a lookalike YF-12 for several years.)

Good day, Internettiteers!

Anyone out there know if there's a source of the most current
Part 97 revisions available via FTP or Email? I own several
copies of the WY5I (I think) copy dated October 1989, and I
suppose that I could send money to the US Govt Printing Office and
get a subscription to everything ever printed, but I'm lazy and
my postman would hate me anyway...

I installed wone of these the other day, and not knowing what to
do with the old display, I (what else...) took it apart to see what

made it tick. (Inquiring minds want to know...).

The old display is actually an LCD also. Unfortunately, Kenwood went to great lengths to defeat the main strengths of an LCD.

First, I should describe what I found. The LCD display panel is masked with black everywhere that there is not a display element. Such that if all elements were turned on, that is, blackened, (no flames about whether black is "ON" or "OFF" please, I prefer to think of black as on. OK?) the whole display would be completely black. If all elements were turned off, that is "clear", then you could see all of them, but only by looking through them.

Behind this display is a piece of plastic with areas colored in the color that Kenwood wanted that area of the display to look. Behind this is a simple "light pipe" -- clear block of plastic with small "grain of wheat" type light bulbs mounted around the edges.

The LCD elements are used in reverse of the normal LCD display. That is that an element is made clear when it is to be seen, made black when it is not intended to be seen.

Normally, an LCD is visible by masking the background light, which either comes from ambient light during the day or the internal back lighting at night.

The problem is that the little bulbs used by Kenwood could not overcome the ambient light during the day, hence...you couldn't read it. The display wasn't that great at night either because the colored plastic filter attenuated the light so badly that the display was quite dim then.

Kenwood had a good idea when they tried to make a colored display using LCD technology, unfortunately, they appearantly failed to test the thing outside of a darkend lab. Too bad. A real design SNAFU. I hope someone got chewed out over that one. I know I would if I had done something that dumb.

By the way, I believe that a '721 with the new display, or the new '731 to be a near perfect radio. (All radios have warts, I just hate it when they design a great radio and then put in one fatal flaw...)

PS, the term "WART" is my word for a "MIS-FEATURE".

Yes, a friend an I wrote one that has been widely distributed in Utah and other areas. It has too many features to describe them all, but here are a few:

- Does not require calibration for speeds up to 50+ WPM
- Supports "Farnsworth" method (fast chars with slow spacing)
- Menu driven
- Provides practice in random code groups, plain text, random QSO's, random words, random prosigns etc.
- Many many many many more features...

Contact Jim Raehl, N7KXI (good in the callbook or use the work phone number in my .sig)

The program will soon be distributed by Antennas West (check for ads in the common Ham rags...)

I wrote most of the low-level code in the thing, and believe it to be one of the best programs for the pc around. (Me biased? Naaa...)

I recieve nothing for this, just many warm fuzzies when I can help a prospective ham.

By the way, it is being used by several of the local VE teams for code exams.

73 all!

Just wanted to clarify a previous response regarding cellular phones. Cellular phones are NOT scrambled (encrypted); although there are many cell phone salesmen that would like their customers to believe this. Cell phones operate in the ranges 825 to 850 MHz (mobile input channels to the cell site and 870 to 895 MHz (base output channels) from the cell site. A cellular phone might be an acceptable substitute for a CB radio, but only in metropolitan areas (large cities). Most cellular services have agreements among each other which will allow a cell phone under one service (such as Cellular One) to use another service (such as US West Cellular) in areas not served by Cellular One. I don't know what charges are in other parts of the country, but in Colorado Springs, a cell phone may be purchased for 300 to 600 dollars with monthly fees from 15 to 50 dollars per month depending upon the number of calls made.

For general purpose emergency use, I would still recommend the use of CB rather than cellular.

   As of 5 april 1990 MININEC3 was not in the CMP directory of SIMTEL20.
There are a few propogation programs and some other items.  The directory
is only 20 files.

Last night I spent a frustrating evening trying to listen in on some various commerical and ship-to-shore rtty traffic on the shortwave bands. I once got some recognizable traffic, but mostly gunk. Even when the stations were S-9plus, still gunk. Is everything encrypted or am I doing something wrong? I'm receiving on LSB, and also use the FSK setting on my TS-440. Ok in the ham bands, no problem there.

I'm using an MFJ 1278 multi-mode data controller, and another irritating aspect of its use is that it does not auto configure to the mode/baud being received. (I understand that the PK-232 does this) For example, the station might be 50, 75, 100 or some other baud and the practice of trial and error with the MFJ baud settings is infuriating.

I'm using MFJ firmware release 2.2 and the OPMODE command does not work either. Can anyone shed some light on these topics?

Thanks in advance,

-fred

I've heard rumors that there is a 3-year-old that just took AND PASSED the 5 wpm Morse Code test in Oklahoma. Presumably, this 3-year-old cannot read, does not know her alphabet yet, cannot write, so is normal in most respects (how many 3-year-olds do you know that can do Morse Code though?).

The test was taken on a computer.....her father (also a ham :-) taught her "when you hear di-dah, press this key, the A key". I believe the father is now trying to figure out how to get her past the Novice Written test, within the year before the Certificate expires.....

Anyone have any first hand knowledge about this rumor? I'd be interested....
Who said that "not everyone can learn Morse Code" .....:-)

I'm interested in the details for j-pole contruction. Please post the info in the group, as I'm not familiar with e-mail outside this area.

Thanks in advance,

Dear friends ---

I will be returning home to Kuala Lumpur, Malaysia, at the end of May. I have been operating N3FLX while in the States. I plan to be active on the OSCARs and Moonbounce from 9M2 land.

If there are any hams out there who would like to dispose of any items that may be useful to me, I will greatly appreciate that. I am looking for items would enable a good satellite and moonbounce (2m and 70cm) stations to be setup. My moonbounce experience was gained at K3CR (Penn State Amateur Radio Club station) and taught by AF1T (2m WAS #100). It is my dream to finally setup a super-duper moonbounce station.

So, if anyone would like to donate any items of interest, please e-mail directly to me or through packet. Until then, 73 and hpe to cu soon.

Ahmad, N3FLX/9M2DX.

The big disadvantage of phasing SSB compared to filter type SSB comes to light when you look at carrier suppression. It is extremely difficult to get a mixer with good enough balance to get decent carrier suppression without operating the mixer at such a high level that unacceptable IM distortion is generated. Suppose a mixer has +7 dBm. LO drive and 40 dB. LO-RF leakage (a very good spec, rarely found). The LO will then come out of the RF port at 7-40= -33 dBm. To get 40 dB. third-order IM distortion you need to operate 20 dB. below the third-order IM intercept, which is typically 6 dB. higher than the LO drive, or 7+6= 13 dBm. 20 dB. below this is 13-20= -7 dBm. So you drive the *input* with -7 dBm. and with 6 dB. conversion loss, you get an output of -13 dBm. Since the LO is at -33 dBm., the carrier suppression is only 20 dB. Ham rigs that did better than that either had lousy IM numbers or used amplitude and phase "tweaks" to null out the residual leakage from the mixer, at least at one temperature.
That, in a nutshell, is why you never see phasing rigs anymore, and never did see them in commercial equipment which has to meet tight FCC specs. Phasing SSB is pretty much a ham-only technique at least for transmitters.

In a filter type exciter, an assymetrical filter with a very tight skirt on the carrier side is used to get an additional 20 dB. carrier suppression. Also, any IM generated in the balanced modulator is filtered by the SSB filter so it doesn't upset the FCC, it only causes audio distortion. Another ham-radio-only technique is to used a cheaper symmetrical SSB filter and change sidebands by switching the carrier oscillator crystal to the other side of the filter. These radios can be identified in some cases by the dual dial graticule lines on the front panel spaced 3 kHz. apart. The switched crystal technique usually makes it necessary to have a user operated carrier null pot to get decent carrier suppression.

Once again I have decided to improve my CW skills. This time intend to
succeed and to help I would like to get a good PC training program.
I have alredy looked at some and none of them do what I would like. I would
really like a program whereby I can send individual characters at 20 WPM
but spaced at some slower speed. This is how I got to 13 WPM by listening
to the sound of the character, and then increasing the effective WPM.
If anybody knows of such a programe please let me know.
Thanks and 73's
Geoff Williams

My wife and I will be taking a cross country car camping
trip starting June 17th. I plan to haul a packet rig with
me. We have done the 2 meter mobile packet routine in the
past and have enjoyed it.

I would appreciate receiving any packet maps of the areas we
will be traveling thru. From past experience, you find
PBBS's in the strangest places. I would hate to miss one
because I didn't have their frequency.

We will be driving down the Alaska Highway, across Canada to Manitoba, and eventually to Washington DC and back home again the same way to Juneau Alaska. We will drive thru British Columbia, Alberta, Saskatchewan, Manitoba, N. Dak, Minn, Iowa, Wisc, Ill, Indiana, Ohio, Penn, MD and West VA.

Send the packet maps to me via packet or BITNET. My addresses are KL7RH@KL7HFI or KL7RH@KL7AW by packet. I can also be reached thru BITNET at JSDCF2@ALASKA.BITNET

Thanks.

Duncan Fowler, KL7RH

I'm wondering if this is really illegal. I think you can get a scanner that will scan in the 800Mhz bands, so it is possible. And ANYTHING in the air is, as far as I know, public property -- including government bands, cellular phones, Radar waves (The major argument in the case against anti-radar detector laws). I believe the Supreme Court decided this awhile ago. Does anybody have any details? If I said I was sure I was right, I'd be a liar, but I'd like to know exactly what the laws say.

Oh, and of course the salesman told you it was impossible and illegal -- he is a salesman, and likely was just as lost as I/we are. :-]

```

I have a few questions that may quickly be answered by the net.

The local HAM club has recently installed an autopatch on the local university repeater (best repeater for local coverage and availability, etc.). It has been a long haul (1.5yrs) to get all the technical things worked out with the university club supporting the repeater and our club handling the autopatch side.

We have finally decided to open the patch to all users as long as we can get the financial support to pay the phone bills from those who use the patch (the repeater owners never asked for money for the use of the repeater). Our club has paid for the autopatch and the first year's bill in advance and it is up to the university club to maintain the repeater (this was a joint project and everything has worked out well).

In this effort we have felt that maybe we (two clubs) should form some sort of association (non-profit) to handle the money dedicated to patch/repeater support. HOW DO WE DO THAT? Is there anyone out there who has experience in this area? What has to be done for non-profit status? Can we even be considered for non-profit status if the money only goes to supporting the repeater/patch?

There was even talk of incorporating to cover us if somebody decided to sue because something didn't work when it was supposed to (like emergency autopatch). While we all believe there will never be a problem, there is always that chance, and I would like to review all of our options before we resort to closing the patch to only members of the two clubs who financially support our efforts. This would be a shame since our intention was to provide a community service by installing and maintaining the autopatch and improving the repeater.

I would appreciate any and all opinions......

Thanks,

Greg May gregm@hp-pcd.HP.COM

Has anyone had any experience with increasing the receiver coverage of a Kenwood TR-2600A 2m handie-talkie? I am mainly interested in covering the 160 MHz range for NOAA broadcasts, etc. Some time ago I was told that this could be accomplished by clipping a diode, but I never followed up this. Any Suggestions?

Thanks,

Glen / W9LS

commgrp@silver.ucs.indiana.edu (BACS Data Communications Group) writes:

> >One way to implement the audio phase difference for the phasing method of SSB generation is described in _The_ARRL_Handbook_ and in Horowitz and Hill's _The_Art_of_Electronics_ 2nd ed. page 295. They call it a phase-sequence filter and it consists of a cyclic network of resistors and capacitors, driven by two signals of 180 degree phase difference, producing four outputs 90 degrees apart. Does anyone here have any experience with these filters? In particular, how are they designed and analyzed? References?
> >Thanks,
> >Bob Kelley
>
> This device is an all-pass network with constant phase shift throughout the speech spectrum.
>
> See _QST_ January 1988, p. 16: "A New Breed of Receiver" by Gary A. Breed, K9AY (who, incidentally, is the editor of _RF Design_ magazine). This article contains the schematic for an active 90-degree audio phase-shift network using 8 operational amplifiers. The article also contains an excellent explanation of how the phasing method eliminates one sideband.
>
> The advantages of the phasing method is that it requires no expensive RF SSB filter, and is frequency agile. A properly-aligned phasing-type transmitter is said to have better audio quality because there is no ringing from a sideband filter.
>
> Disadvantages: The phasing method requires _two _ balanced modulators, and phase-shift networks for both audio and RF. It has a higher parts-count, and is more difficult to align. Perhaps it will become more popular with the advent of inexpensive Direct Digital Synthesizers (DDS) which can easily produce quadrature RF.

Deja vu time. Or "This is where I came in, Merv."

Phasing rigs were the first ones I had experience with back in the 50's. The first inexpensive ham SSB rig was the SSB, Jr., described in the GE Ham News, published by the Electron Tube Department of General Electric. This radio was spiffied up a little by Wes Schumm and produced in kit form as the Central Electronics 10A. It had a 6AG7 tube as the Class A output stage and generated approximately 10 watts PEP. C.E. also produced a phasing type receving adapter called the "Signal Slicer". Both employed passive, RC phase shift networks.

To facilitate homebrewing (That was still common back then.) both the

Millen Co. and Barker and Williamson made phase shift networks for those who didn't have what it took to match precision component values and trim and measure the results. B&W made a particularly popular one called the "2Q4", which looked like a small metal shell octal base electron tube.

The phasing method had all sorts of advantages but died out because it was difficult with practical passive networks to keep the phase shift error low enough across the entire bandwidth to keep the unwanted sideband suppression above 30 to 35 db. without adding crystal or mechanical filters. Of course, once you start adding the good filters that became available during the late 50's and early 60's, why bother with the phasing section?

It's rather fun to watch over the years as one technology after another is "revisited" as new developments make possible applications of them that weren't possible earlier.

I think it has more to do with your distance from the magnetic North Pole rather than the geographic one. Marquette is pretty close to the magnetic pole. Here in Fairbanks (65deg) auroral activity is high. Pretty to watch but bad for HF communications. One period last summer I came back from a backpacking trip to find HF totally dead. The only thing I could hear over entire range of 540 KHz to 30 MHz was local BCB stations.

Interestingly, packet on 2m is quite popular around here.

The QSL route for AH3C is via K9UIY.

The QSL route for AH3C/KH5J is via OH2BN.

So my learned friends WN4KKN and K6ZH were both right, sort of.

To confuse things further, T32BS was AH3C en route to Jarvis Island,
choose your own manager :-)

This is true. Imagine the following communications path with a narrow-beam
transmitting antenna (say a large dish) and a receiving antenna of a certain
aperture:

```
                            . . |
                                           .  .     |
                                     .  .           | Receiving
                                .  .                | antenna
           Transmitting    | .                      | aperture
        Antenna         |    .  .                |
                        .  .           |
                           . .      |
                            . . |
```

(The dots represent the edge of the transmitted beam.)

If you scale the entire system up by a factor of two (lower the frequency by 2, double the size of both antennas, and double the path length), the above picture doubles in size. The spreading angle of the transmitted beam stays the same, since the antenna gain is the same, but the receiving antenna aperture doubles. The path loss stays the same.

Looking at it another way, if the path length had stayed the same, then for same antenna types, the path loss would go down (improve) by 6 dB with a 2X lowering in frequency. This is cancelled out by the 2X increase in path length.

The same holds if you transmit with the right-hand antenna and receive with the left due to the principle of antenna reciprocity.

Al N1AL

I have a Drake TR4C to which I'd like to attach a digital frequency readout. Are there any such displays readily available, or perhaps a source of plans for such a display?

Also, I am looking for any and all mods I can get for this rig. If you have any, I would appreciate hearing from you.

Thanks!

Bad news in the Amateur Radio publishing world.... Ham Radio Magazine has been sold to CQ magazine. They acquired all rights to the name., the bookstore and the name "Ham Radio Horrizons". Publication will stop immediately. Current subscribers will have a choice of filling out your subscription with CQ or getting your money back. I think most of the subscribers will do the later. Jim Fisk must be rolling over in his grave. I for one will be sorry to see HR go. I guess all good things must come to an end.

Does anyone know the status of the Japanese Tono Corporation, maker of
HAL-like RTTY gear like the Theta-777? I noticed their absence from
Dayton and can't remember if they were there last year or not. I have
a couple of theories:

1. They are kaput

2. In the wake of declining interest in the States, they are not
bothering to go outside Japan.

Frankly, I'd be surprised if they vaporized, considering the lack of
suppliers of such equipment in Japan.

HI Manuals, located somewhere in Iowa (I can't find my copy of their catalog)
stocks manuals for just about any receiver/xcvr/transmitter made, and their
prices are pretty reasonable. Their ad can be found in the ads of any
issue of QST or other such magazines. Good luck.

Len

I have had similar problems, and hope someone can be of more help than
I can, (I have more additional questions than answers) but...

I use a PK-232, and most of the RTTY traffic I find comes up as
"synchronous" when I run the auto configure signal mode. I therefore
don't think the signal is really scrambled, but rather in a mode which
is not easy for the PK-232 to handle. It would be helpful if someone
could explain how synchronous rtty works. Ie, is the timing information
transmitted over a different frequency?, over the other sideband?, or

do they just rely on very accurate baud rates? I don't know if there is some other software way of handling the synchronous mode.

As to the possibility of "doing something wrong", two possibilities not mentioned above, are polarity (or bit) reversal, and audio signal level. With the PK-232, even if the baud is correct, if the polarity is reversed, the rtty is not readable. The PK-232 has a convient reversing function. Switching to the other sideband, and/or fine tuning (or detuning) the freq might also help. Also, I have found that the audio level of my Kenwood 2000 is too high (or perhaps has insuficient rc damping) for the PK-232, such that noise registers as data, giving "gunk". I have much better results using a supposedly inferior (Sony ICF5900) receiver, which has a more damped audio output.

Fred, the pk-232 does not autoconfigure to the mode/baud being recieved. It has what they call a SIAM mode which attempts to decode what is being revieved and lets you know. But in amateur practice, if you are copying RTTY in the amateur bands, you still have to switch baud rates by trial and error to get it right. If you come across an ASCII station, you will have to switch the pk-232 from BAUDOT to ASCII. Although I like my pk-232, I think your MFJ 1278 is probably comparable in functionality.

As far as copying commercial stations goes, try the following. Most non amateur stations do not use 170 hz shift. Have you tried 425 and 850 hz shifts? If not try this first. Many non amateur rtty stations are not using FSK, but rather employ more esoteric modulation schemes.

Try calling Universal Radio (in ohio?) for information. They have lots of literature and products for the rtty enthusiast

The rock group Rush has a song, YYZ, which is an instrumental piece based on the (International) Morse code for "yyz" - it has a pretty strange time signature as a result!

DAHdiDAHDAHDAHdiDAHDAHDAHDAHdidit... (repeat)

The letters are run together, though... That's why I never noticed it until I saw it mentioned elsewhere on the Net!

considering that it has been stated here by various VE's that using a typewriter
to copy the code test isn't allowed cause the rules say by hand, I hardly expect
they let anyone use a comppputer. Add into that the illogical (for a child)
layout of a QWERTY keyboard and this story really looses credibility.
I personally would need a lot more verified info before I believed it.

  After about 6 weeks of waiting, the $50 shortwave receiver from DAK
finally arrived. Mind you, I didn't expect too much for $50, but I was
still quite disappointed initially. AM and FM broadcast reception is OK, but

the thing is basically useless for SW with the little whip antenna attached. The only thing I could hear was a *weak* WWV on 15 MHz. Mind you, in the same room was a 30 year old 5-tube Grundig, with a 3-foot piece of wire that was picking up LOTS on the same frequencies. At first I thought it was kaput, but I hooked up my ham-band delta loop to its external antenna jack, and it came alive. This fault seems really dumb, as gain is relatively cheap to build into a SW receiver. (selectivity, image rejection and dynamic range on the other hand...) Even given its 'deafness', I did hear a touch of overload from the local 1kW BC station, about 3 miles away.

I brought it into work today and hooked it up to a calibrated signal generator, and made the somewhat crude measurements below. I also attempted to peek inside, but didn't get too far. I got the back cover off, but that only lets me see the back side of one of the PC boards. It seemed to be glued or heat staked to the 'front panel'. It seemed to have a surprising number of discrete components, though, along with 2 or 3 DIP IC's that I could see. If I decide to keep it I may look some more..

At first I was ready to send the thing back, but now I'm not so sure. I could probably add a little RF amplifier, either internally, or externally, and it would be quite serviceable for casual use.

It is kinda cute. The tuning with the up/down button is tedious, and it will 'scan' if you hold them down for a second (not too useful on noisy shorwave freqs) It also has a jack for an external 6V power supply, something Drew didn't mention in the catalog.

DAK MR-101 Synthesized World Band Receiver

Sensitivity (for minimum discernable signal):

Freq	Sig Level
3.2 MHz	40uV
5.0 MHz	14uV
7.0 MHZ	7uV
10 MHz	8uV
14 MHz	7uV
20 MHz	4uV

Image rejection:

~ 6dB at 12MHz (that's right, 6!)

IF frequency (SW1 and SW2): 440 kHz (I attached a loop of wire to a spectrum analyzer and held it near the back of the receiver. The largest spur seen was always exactly 440kHz above the dial frequency.)

I posted recently on another topic and claimed that other administrations besides our would record stupid activity on the ham bands and use this at the upcoming WARC to justify their claim that we do not deserve our allocations. It has already happened. Recently, two European countries, serving notice ;-(sent recordings of the Bouvet operations to the FCC. The FCC sent this to ARRL with a message that went something like `this is your mess, what are you gonna do about it.' This precipitated the highly controversial DX-pedition and contest suggestions/rules etc. that have recently been proposed. We are in real danger in 1992. Land Mobile has before the WARC a proposal to convert all between 1000 and 3000 Mhz to Land Mobile. We had better get our act together and fast.

Bob

This is bad, but it is not as bad as it would have been if it had happened before HR went and watered down the (already skimpy IMHO) technical content in their articles.

>I for one will be sorry to see HR go.

I also will be sorry to see them go. At least there are some good technical magazines still available. Dubus from W. Germany for example. Feedpoint from North Texas Microwave Society.

I think the content of the major American amateur radio magazines mirrors the sad sorry state of the amateurs in this country. Most hams are too lazy to get off their butts and build anything, and indeed most couldn't even if they had the ambition. Of course, there are a few exceptions, but the condition of the majority spells eventual defeat for the amateur radio service (IMHO).

Gene (WA1UXA) informs us:

> Ham Radio Magazine has been sold to CQ magazine ... Publication will stop
> immediately.

This is terrible. I was excited when HR announced that they were revamping their efforts - did you notice their new cover page, "NEW HAM RADIO" - I liked them for coverage you don't find elsewhere. They struck me as a sincere publishing company. Their monthly mail order catalog failed to leave a distinct impression with me, though - I never felt HR was selling products you couldn't get elsewhere.

So I guess now there are basically three ham magazines left in the U.S. - QST, CQ, and 73 - plus some electronics magazines. Is this part of the declining trend of the American amateur radio industry? Magazines rely heavily on advertisement revenue. As the number of manufacturers and retailers diminish, magazines lose money, and as they lose circulation, they drop their advertisement fees, and so the products sell less.

One thing I always marvel at the Japanese domestic market is the intense effort in advertisement and packaging. Sales brochures are much more detailed than the North American versions, and stores are brightly decorated inside and out. "CQ Ham Radio" magazine (the JA version) is one of the top three best-selling monthly magazines in the country, and there are several other ham radio and/or scanning rags as well. I really don't know how they manage. Getting a license there is so much of an hassle.

Which leads me to my perpetual questions that never gets answered:

Here in the U.S., amateur licenses are *so* easy to get (less than five dollars gets you both operator and station licenses? good for ten years? wow), amateur stations are *so* easy to install (you got lots of space - 40m is the second most popular HF band in Japan, but a fullsize 40m dipole is a rare luxury), amateur radio regulations are *so* generous (third-party traffic is illegal in many parts of the world, and in Japan, only JARL can own repeaters). So how come more people don't get in the hobby?

I digress. My main lament today is that I see another passing of a good thing.

The PK232 describes anything as synchronous if it couldn't find obvious start and stop bits in it.

A lot of what you hear as HF RTTY is multiplexed, with more than one data stream being transmitted at the same time. It takes equipment a little bit fancier than the PK-232 to decode that.

As you may already know, CQ magazine has bought out HAM RADIO. The last issue of HAM RADIO will appear in June 1990. I just spent a while on the phone talking with Skip Tenney(sp?) the owner of HAM RADIO an some of the staff there. Terry Northup and Craig Clark will be staying on in the offices in N.H. What will happen to CQ (will it expand its coverage), whether there will be new periodicals (maybe quarterly) and other subjects are as yet undecided - everything is in a state of flux, as you might expect. The rights to the name HAM RADIO and HAM RADIO BOOKSTORE also go to CQ.

I should declare an interest in HAM RADIO since I was a columnist there, but on a less personal note, I think that HAM RADIO was the only real technical amateur radio journal published in this country and was run by people who were concerned about amateur radio. Its passing is very bad news indeed.

CQ is published by CQ Communications (Dick Ross, who's call I can't remember), which also publishes Modern Electronics and Popular Communications. I can only urge HAM RADIO subscribers and anyone else with views about what constitutes a good amateur radio publication to write to Dick Ross at:

CQ Communications
76 North Broadway
Hicksville
NY 11801

Tell him exactly what in an amateur radio publication will make you keep up or take out a subscription. Subscriptions are what commercial publishing is all about. More readers=higher advertising rates+more revenue=more profit.

What with last year's cut back of QST and now the loss of HAM RADIO the outlook is bleak for those interested in technical aspects of the hobby, and microwaves in particular.

I just got through writing my own satellite tracking program in Turbo C and I now want to use it to track DOVE-1. Unfortunately, I have not been able to find out what the Keplerian elements are for DOVE-1 or any of the other Microsats for that matter. Would it be possible for someone to publish the Keplerian elements for the various Microsats and other interesting satellites in this conference area or can someone at least recommend a publication or something that is easily available so I can get this information? Thank you.

You'd have to do it heuristically. If you delay your acks a bit, you'll know that a sender's MAXFRAME is greater than 1 when you see a second frame come in before you have transmitted the ack for the first frame.

I should say it would be a bad idea to actually implement such a rule. As much as I'd like to see people run AX.25 in stop-and-wait mode, I think the Robustness Principle is more important.

Simply stated, the Robustness Principle says "Be conservative in what you send, liberal in what you accept from others". Come to think of it, that's not bad advice to the participants in a certain flame war already consuming this newsgroup...

Phil

If you are in Texas and your girlfriend is in New York, it would have to be an HF system of some kind (Distances are too long for VHF). I would suggest a radio that can cover the 20, 15, and 10 meter bands anyhow and general class licenses to operate voice over them.

These radios could probably be picked up at a ham auction or hamfest for about $200 each.

There is going to be at least one problem with this. How can you coordinate this so that you will find each other on the radio? You may be able to pick a time and frequency in advance. Also, how well the radio waves travel varies depending on time of day, month of the year, and this 11 year sunspot cycle that also is an influence. This will tend to complicate picking a time and frequency as above.

Go for a good antenna. I recommend a 3 to 5 element beam up on a tower. It is probably more cost effective to get a better antenna than another radio, since the antenna halps on both transmitting and receiving. Antennas and the towers can be expensive however, and may end up costing you more than you paid for your radio.

You may also want to check out whether using ham radio to avoid a toll charge is really legal.

Good luck.

Effective today, both north and southbound I-75 are 1 lane ea. Suggest trying an alternate route to HARA Arena if you are arriving from the South. Some possibilities are:

1. Take the Salem Ave. exit, take Salem Ave. to Shiloh Springs Rd, turn right. (Lots of traffic lights, but good 4-lane streets).

2. Take Main St. Exit (SR 48), turn left, take 48 to Shiloh Springs RD, turn Left to Hara. (Likewise, lots of traffic lights).

3. Take Miamisburg-Centerville (SR-725) exit. Turn left on SR-725. Take 725 through Miamisburg, and turn Right on Union Rd. Union Rd is about 2 Mi WEST of Miamisburg. Take Union road about 12 Miles North through Trotwood, OH to Shiloh Springs Rd. Turn Right to get to Hara. This is a country-road route. Note: there is a rather laborous hill west of Miamisburg on 725. Heavily laden trucks (Read: full of boat-anchors) may wish to avoid this route.

>> ARF says:
>> Drivel? What do you call "five nine in New Jersey"?

Well, just a short comment: I (and possibly others) would just as soon that "flame wars" regarding Jack's opinions OR his manner of expressing them be taken either to e-mail or to alt.flame; I'm not sure they have a place here. As for me, while I certainly don't agree with all - or possibly even *many* of Jack's opinions, he is certainly well within his rights to have them AND to express them, as long as he doesn't get (A) personally abusive or insulting or (B) obscene. So far I have seen neither behavior *initiated by Jack*. Finding someone else's opinions offensive - without them directing personal attacks at you - is not sufficient reason for calling for their censure. If you don't wanna listen, one of the great things about radio is that you can always reach for the VFO dial. I myself get tired very quickly of the "you're five-nine, QSL?" variety of contact, but find most folks for some reason simply assume that Most Things Shouldn't Be Discussed on the Radio. (Just like that, caps and all - a taboo handed down by the Radio Gods.)

I do have a couple of questions I've always wanted to ask Jack, though, and assuming that he's still following this string, now's as good a time as any: First, why is it "ARF says" rather than "Jack says?" Do you consider yourself to BE the forum, or are we to assume that the opinions of everyone in the forum will agree with those you present under "ARF says?" I doubt that you intend to give either impression. Second, and this is more along the lines of a Gentle Suggestion than a question - don't you think that many might find the "lighthouse of wisdom and truth" bit to be just SLIGHTLY arrogant? Hopefully, a number of diverse opinions could be brought to your forum, and certainly not ALL of them could be considered "wisdom" and/or "truth." I'd also hope that you do not intend to give the impression that your own opinions are infallible. Perhaps a better slogan might be "SEEKING wisdom and truth", if that truly is what you intend. Not a flame, Jack - just a comment from Another Observer.

I recently bought a handheld Scanner from DAK, Regency R 4030, that boasts 800 MHz band coverage. Well actually it gets part of the 800 band on the high and low side, but the middle of the band has been locked out. I was wandering of anyone new of a quick fix that will "unlock" these frequencies. Since the PLL is capable of capturing even up into the 900 MHz band I assume it's not a problem with the capability of the unit but rather Regency purposely is restiricting these channels.

I had heard about clipping some diodes or something like that. This scanner looks identical to Bearcat scanners except for some of the plastic colors. The R 4030 is a 200 channel programmable handheld if that helps any with identification.

thanks,
doug

I've been bitten by the bug of acquiring an old Drake 4-series HF station, such as the T-4XB/R-4B, TR-4, SPR-4, etc. I'd appreciate it if some Drake fans out there could inform me as to the differences among models (R4B, R4C, etc.), what features which model has/doesn't have, how well they work compared with each other and/or modern gear, how much I should pay for clean examples, bugs to look for, etc. Besides general HF operation, I'm particularly interested in noise blanker performance (urban power line hash), and ability to be crystalled for SWL and WARC bands in addition to 80-10. Thanks much in advance and 73!

Yes, you can probably use these TWTs successfully at 10 - 10.5 GHz!!!

TWTs have very wide bandwidth. You probably won't get the rated gain
out of them, but you will probably get useable gain (>= 5dB). I have
done this on X-band. You will probably want to use a very strong
electromagnet, even stronger than the original one used in the
amplifier (if you are starting with a whole amplifier). This will yield
higher effeciency.

In pulse operation, the duty cycle is usually less than 1%. I would
suggest perhaps (duty cycle <= 2%) == pulse, (duty cycle > 2%) != pulse.

On another note, I would like to see the restriction on pulse emissions
in our X-band lifted. (I know why it's there; if you want to know, just
think about what you could do with a mobile transmitter with a "pulse"
frequency carefully chosen. However, the law is toothless, because a
string of dits at the same carefully chosen rate has the same effect.)
If we could use pulse on X-band, we could achieve very long distance
communication reliably over very long (over the horizon) distances.
This would be an excellent technology to build a high speed inter-city
packet backbone with. Oh well, we can still do this legally at 9cm or
6cm or 11mm.

Am I missing something? It seemed to me that you wouldn't benefit from a low duty cycle when fighting a large path loss.   I would think that some synchronous system, with correlation detection of some sort, would be the best bet. Of course you COULD build a receiver that just listened during the narrow pulses to ignore the in-between noise. I'd also worry a bit about pulse-spreading due to multipath. Maybe a pseudo-random scheme would be a good approach, but would likely have a mid-to-high duty cycle, and thus not be pulse.

Or do you have a good source of low duty cycle 10 GHz power, and want to build a system around it?

Pardon the confused questions, but I don't normally think of low-duty-cycle pulse transmission and weak signal operation as going together.

Bob W3OTC

PS. Look at the picture of the 10 GHz SSB PHONE station in QST (I thought in W3XO's column, but can't find it.) I've seen and heard '3XO's video of it operating over a non-line-of-sight 25 mile path with excellent sigs.

The power output was in the 20 - 100 mW range, I think.

I'm a bit perplexed by this statement considering how much traffic AX.25 moves each day even in the hostile environments like HF. If you mean that there are features in the AX.25 protocol that you find distasteful, then I agree, and we'd probably even mostly agree on what's distasteful. But in my book, something that works even a little bit is not "broken beyond repair."

>Given the high levels of congestion, AX.25 can run in one of two modes.

>what are becoming typical levels (which cause the connections to time
>out). Needless to say, most TNC users keep their windows larger than 1.
>Especially our large local NTS bulletin boards. And they don't give a
>s*it when yo tell them to fix it.

You are confusing poor RF engineering with protocol deficiences. I think we'd all agree that most any protocol, especially any CSMA protocol will perform poorly on simplex networks, especially those based upon simplex digipeaters. On the other hand, a properly engineered full duplex RF environment is practically immune from collapse. I've proven that pretty conclusivly here on the 146.73 LAN channel.

>You'll note that much of BBSnet is one-hop "message switched" non-real-time mail. That's not even "packet switching", but store and forward BBS operation. Nothing wrong with it, but it's slower than it would have to be if the underlying network were better.

BUT... Store-and-forward most suits most hams' needs just as store-and-forward usenet news suits most readers here. Store-and-forward does not have to be slow. Again let's not confuse problems in a particular implenentation with problems with the concept. Sure W0RLI's once an hour forwardind model is slow. On the other hand, I can show you a commercial system I've designed and implemented that is NOT slow.

>TCP/IP, on the other hand, has dynamic retransmit timers and selective recovery of lost packets. So if you get clobbered, you don't have to retransmit the rest of the window, and you can run a larger-than-1 packet window size. Of course, sharing a channel with AX.25 is a clear case of the obnoxious driving out the polite...

Or more accurately perhaps, a protocol with characteristics more suitable to the RF environment is driving out one that is less suitable. Features do not make functionality. Dynamic retransmit timing, selective recovery and the like do absolutely no good if they are not appropriate to the environment. If the backoff algorithm falsely attributes a retry to a collision (which it must) and backs off into oblivion when the lost packet was actually lost because of poor signal conditions, then it does not fit the application and performs worse than an "inferior" protocol that is better matched. At least around here, most of the time, a bit of hammering will get a packet through.

>Need I mention digipeaters?

I guess digipeating and the emotional hate directed at it is the focus of this philosophical debate. I'll stipulate that digipeating is a hack and is little better than aloha in terms of thruput. You'll also have to agree that despite its warts, digipeating gets the traffic through.

This is the same problem I face as a development manager. Do I fail to deliver a product to a customer because some needed feature is missing or do I put in a quick hack that works less than optimum and ship it? My customers invariably say "hack it". And my superiors are generally happier with the latter approach.

It's the same for ham radio. Do we tell potential users that we can't connect 2 areas because digipeating is grody or do we put a digi up and live with the lousy but greater than zero thruput? To me the answer is obvious.

Or do we put up a technology that does not work very well, is hard to use and is unreliable but is "pure" or do we put up what the users want and what works best? Again, the answer is obvious. I hope you keep in mind my distinction between productions and experimental networks.

I once again seem to be casting myself as the great defender of AX.25 and the currently stagnant environment that exists. Such is surely not the case. I look forward to the day when a fast and reliable network exists that is practically transparent to me as a user. I suspect that this day will not arrive in my lifetime. Those who promote TCP/IP as the next best thing to God tend to fool even themselves with promises sometimes. We tend to brush complexity under the rug with terms like "automagically". And we tend to represent the ham radio network with the same nice cloud model as we use for commercial models. Sure the Internet is accurately modeled by that cloud - a status that has taken millions of dollars and man-hours to achieve. A more accurate model for ham radio in the forseeable future is a series of disjoint line segments separated by air.

Phil's code is a very accurate duplication of the environment one finds in a Berkley IP environment. (And it would be an accurate model even if phil decides not to emulate the kernel panics :-) It works fine on the ethernet or on SLIP. I use it everyday for that environment. And when something breaks the network, I can fix it and am paid well for doing so.

But when we throw this same environment onto non-sophisticated hams, the situation is quite different. Not only is the user interface alien, hard to use and cryptic, we have moved all the complexity of network management off a few nodes and into each ham's shack. This, I submit, is negative progress. Promises of future servers to address all problems do not aleviate the situation.

But even this is somewhat tangent to the point I was trying to make earlier. The point is that once we become service providers - and I enjoy that role almost as much as experimenting - we have an obligation to take our users' time and money and spend it wisely. Erecting networks that don't work or which don't fit the users' needs is not wise management.

Between IP not working very well, the vendors' headlong rush toward proprietary protocols for RF faster than 1200 bps, and the limited time available to the worker bees, I see 1200 bps AFSK being the lowest common denominator for quite some time to come. Anyone who wants to prove me wrong on this should a) design a cheap transverter front end for our WA4DSY modem, b) design a high speed driver for said modem, c) design something faster and better than our kit and d) put them in kit form that can be easily obtained and assembled. One should probably also pick up the phone or the pencil and contact the packet vendors and tell them to cut the proprietary shit and agree on a high speed standard and then to start building some hardware. Dale's 56kbps modem can be had for a song. In the absence of anything better, it would make a quite nice standard.

I'm afraid, though, that the highest production from the ham community in the forseeable future will be that commodity, hot air. I sure hope I'm wrong.

John

> wrong about this???

No, you are not wrong. At 225 MHz, the ANSI RF Protection guidelines in terms
on the mean squared electric field strength is 4000 volts squared per meter
squared,
and the magnetic field strength is 0.025 amps squared per meter squared. These
are for near field exposures. From the antenna you briefly described, the
front to back ratios are typically on the order of 3-6dB. So, depending
on the power, the technician could have eaisily been exposed to RF radiation
which exceeds the ANSI guidelines. (There are other considerations, also.
I'd recommend reading ANSI standard C95.1-1982, Safty Levels with respect
to human exposure to Radio Frequency Electromagnetic Fields, 300kHz to
100 GHz).

>
> 2 In the above mentioned RFI testing, the signal level was measured

> does one convert between these units?

The "volts per meter" is the electric field intensity. The quantity used to describe the power associated with an electromagnetic wave is the Poynting vector, which is the vector cross product of the electric field vector with the magnetic field vector. The average power radiated by an antenna is found by integrating the Poynting vector over a sphere surrounding the antenna.

> You hear talk of delivering
> X volts into a Y ohm antenna load giving XY Watts. Presumably, the
> volts/meter is the X voltage divided by the dimensions of the
> antenna?, or is it divided by the wavelength?, or is it divided by
> the spacing of elements in the antenna???

None of the above. In general, to determine the potential given the electric field, one must evaluate the line integral of the electric field over the path for which the potential is to be referenced.

> In any case, it would seem
> that the volts/meter is a better measure of the radiation of an
> antenna since it is representative of the signal after it has left the

> If this is true, why does
> FCC regulate the power of the transmitter, but not the volts/meter
> emmission???

True -- the volts per meter is a representation of the radiation of an antenna. Another is the effective radiated power (ERP), which is the product of the antenna input power and antenna gain. Suppose an antenna receives 1kW and has a gain of 3dB (in the direction of maximum gain). The effective radiated power in this case would be 2 kW.

Both the field strength (volts per meter) and effective radiated power are widely used in the broadcast industry. Why is this not used in the amateur rules?? I would guess its because there are so many variables involved, making it more difficult to control ERP or field stregth. The variables are: transmitter power output, transmission line loss, mismatch between transmitter and transmission line, mismatch of transmission line and antenna, the type of antenna and gain of the antenna, the point where you measure the field strength (100 feet or 1 mile from the antenna??). All of these can eaisily be measure for a fixed transmitter as would be used in the broadcast industry, but would become difficult for an amateur transmitter (since it is not fixed to a specific frequency, the characteristics may change).

The objects you describe sound like the mixing balls used to mix and grind fine powders. The trade name is BURUNDUM and they are made in various sizes by U.S. Stoneware Corp. Since BURUNDUM is an electronic grade Al2O3, they are very hard. You ought to measure the density (density of Al2O3 is 3.96g/cc) to verify. Also try to break one apart (use caution because these little pellets will shatter and make shrapnel) to see it they are homogeneous.
Hope this helps, Laszlo

Ken,
I don't think pulse privileges really are that much of an issue in preventing effective use of the band. As I see it, the main advantage would be in using surplus hardware. However, moderate power narrowband equipment is no longer a difficult proposition. Very long links and OTH links require optimum use of the resources; reasonably efficient use of the spectrum (bps/Hz numbers) and highly directional beams to avoid waste and QRM; as well as physically larger receive antenna apertures to recover the information. Even so I suspect that for reliable networks and comm. channels we are likely to end up with a larger number of shorter LOS links instead of long haul OTH ones. Troposcatter is a fairly predictable propagation mechanism at 10 GHz (see my description of an experience with it on a 400+ mile path during the 1987 10 GHz terrestrial

DX record outing in December 1987 QST) but long haul links are inherently lossier and less reliable than shorter LOS ones.

I strongly agree that we need to use our microwave resources and in particular 10 GHz but I think we will end up finding that for efficient use of our amateur resources we will start looking more like the telephone companies and common carrier folks when we solve the backbone problem.

This would be used for long-haul packet links (~200+ miles, to be exact: Las Vegas-Bishop, California-Reno; a 2M link currently exists along this route, but it's too loaded down). Any info would be appreciated. Note that these links are all on top of mountains > 8500 ft. high. Thanks and 73's, Mike, N7MSD
> P.S. I got a hold of a surplus house that has traveling wave tubes for 2-4 gigs and 8-9.6 gigs. Can the 8-9.6 be used at the 10 gig ham band? A friend of mine said no because they are *very hard* to tune-he says they're something like a helical antenna at their center frequency. Any info appreciated as always, Mike

Mike (and others interested),

Contact wa6exv in Ridgecrest California. He had an oven source phaselocked and putting out 600+ watts well before the RF Design thing came out.
Chuck is one of the founding fathers of the San Bernardino Microwave Society

and a great amateur microwave enthusiast.

Chuck was interested in getting an EME source and as I remember had pretty good luck using raingutter down spout pipe for cheap lowloss wavequide on the band. He should be good in the callbook.

Fixing radios seems to contain a large amount of knowledge gained
from experience. When I talk to different people they all seem to
have little tricks to find problems. Is there a book (or whatever)
that compiles all/a_lot of such knowledge for my own experiences, or
is it just something you can only learn by screwing up or wasting
a lot of time? I do have the basic books like the Radio Amateur's
Handbook, but I was looking for a dedicated text with lots of _lore_
and lists like: "if this happens, it is likely that...".

I would not expect such a book to be the "magic cookie" to solving
broken radios, but just a good push in the right direction. I
realize, that a lot depends on intuition derived from experience.

Digital doesn't really bother me, its the RF and analogue.

A friend of mine who is studying for his license wants product information
on the Kenwood TS140. I do have their data sheet, but a review or personal
testimonials would be better.

I looked back through a few issues of QST product reviews, but didn't find any.

Does anyone remember seeing a review or comparison of the TS140? Or better yet, do they have such a review that I could get a copy of? Just the name and date of the magazine would be appreciated. I'll try to find the issue.

Thanks

John Anderson

The later one implies that mininec3 might also be on wsmr-simtel20.army.mil but I cannot verify it at this time (unreachable) and I also do not have a directory of available files there since I cannot get them from hosts other than BSD UNIX or look-alikes. If you do have UNIX, you can obtain the files I do have of anonymous FTP listings with the following shell script:

```
#!/bin/csh
```

```
ftp -n -v 128.174.5.98 << EOF
user anonymous
cd phil.513
binary
get afindex.tarz "|zcat|exec tar xvf -"
quit
EOF
```

The host has a 5 meg compressed tar file. The above script will directly uncompress and extract this file into several files in a subdirectory and occupy around 20 meg. Check your space with "df" first.

Non-UNIX users: you will need a UNIX compatible toolset with LZW uncompress and tar extraction capability. I intend to make the files available as individuals at some future date, but the host system (CMS) the anonymous FTP is on does not allow the necessary names.

First of all: sorry for posting this article here; I also sent it to the PACKRAD list, but i didn't receive mail from PACKRAD for over 5 weeks. Maybe there's trouble with my local fileserver...

PRE-ANNOUNCEMENT:

For all those of you who wondered, "why not make PR with a simple modem and some cleverly written software like the DIGICOM folks on their C64" - here's the good news:

BAYCOM - as it will be called - is about to be released!

The writer of BAYCOM is Flori, DL8MBT, who had also written DIGICOM! BAYCOM will include all features of DIGICOM (remote commands, screen editor etc.) plus many features more.

What do you need to be QRV with BAYCOM?

Simple question - simple answer: all you need is a PCompatible computer and a serial port - and a modem. The modem is built around the TCM 3105 modem chip and gets it's power out of the RS232 from the PC. Costs: < $30 !!!

BAYCOM has been demonstrated on Saturday, April 21st at the Frankfurt PR-meeting.

I will post more accurate information on BAYCOM as soon as Flori, DL8MBT and Johannes, DG3RBU, will tell me about this exciting new product.

If you have some questions to DL8MBT and/or DG3RBU, you can write them to me - I'll relay them to Flori and Johannes.

REMEMBER - THIS IS ONLY AN ANNOUNCEMENT! DG3RBU told me, that BAYCOM will will be tested for about one month before the first "official" release leaves their test benches.

Have fun with PR! Vy 73 de Ralf, DF1RW

I received some email from W3OTC that I responded to, and thought a posting would be appropriate. Here it is:

% From: Robert Carpenter <rc%cmr.ncsl.nist.gov@usc.edu>

% Am I missing something? It seemed to me that you wouldn't benefit from a
% low duty cycle when fighting a large path loss.   I would think that some
% synchronous system, with correlation detection of some sort, would be the
% best bet. Of course you COULD build a receiver that just listened during
% the narrow pulses to ignore the in-between noise. I'd also worry a bit
% about pulse-spreading due to multipath. Maybe a pseudo-random scheme would
% be a good approach, but would likely have a mid-to-high duty cycle, and thus
% not be pulse.

It is a possibility to build a receiver that only listens when a pulse is supposed to occur, but that wasn't necessarily what I was thinking about. The advantage of using the high peak power of a pulse is that it would be EASILY DETECTABLE even with high path loss. This means that (in theory) you could set up a data link much like CW is used with the human ear: the presence of a pulse has one meaning, and the absence of a pulse has another. There is probably even a better way to do it: consider what you could do if you were to phase modulate the pulses. In other words, control the time delay or latency between pulses. A short time delay could mean a 0 bit, and a long delay could mean a 1 bit.

% Or do you have a good source of low duty cycle 10 GHz power, and want to
% build a system around it?

No, I don't have a 10 GHz pulse source, but they are available. Now if we could only use them legally ...

% Pardon the confused questions, but I don't normally think of low-duty-cycle
% pulse transmission and weak signal operation as going together.

Most people don't. Certainly, I'm not suggesting that real time communications like voice be sent this way. I'm merely proposing that this might be a good use for part of our microwave spectrum. The packet guys are in great need of high-speed inter-city links (among other things).

% Bob W3OTC

% PS. Look at the picture of the 10 GHz SSB PHONE station in QST (I thought in
% W3XO's column, but can't find it.) I've seen and heard '3XO's video of it
% operating over a non-line-of-sight 25 mile path with excellent sigs.
% The power output was in the 20 - 100 mW range, I think.

I've done better than 40 miles over non-line-of-sight paths with only 10 mW and CRUDDY WIDEBAND FM! This was with 2 foot dish antennas on both ends of the path at X-band. Still, I'm not pooh-poohing their efforts; I'm just trying to show that even with simple cheap equipment you can do a lot more than most people expect in the SHF and EHF spectrum.

In article <1250147@hpnmdla.HP.COM> glenne@hpnmdla.HP.COM (Glenn Elmore) writes:
% Ken,
%   I don't think pulse privileges really are that much of an issue in
% preventing effective use of the band. As I see it, the main advantage would be
% in using surplus hardware.

Yes, this would be the advantage. I'm not suggesting that we have an
undue hardship with the pulse restriction; I am suggesting that it is
arbitrary and capricious, and that if we didn't have the restriction,
there would be one more possible way that we could effectively
communicate on the band.

% However, moderate power narrowband
% equipment is no longer a difficult proposition. Very long links and
% OTH links require optimum use of the resources; reasonably efficient
% use of the spectrum (bps/Hz numbers) and highly directional beams to
% avoid waste and QRM; as well as physically larger receive antenna apertures
% to recover the information. Even so I suspect that for reliable networks and
% comm. channels we are likely to end up with a larger number of shorter LOS
% links instead of long haul OTH ones.

This may be true. However, I don't think anybody has ever experimented
with using high-power low-duty-cycle signals to build a packet switched
microwave network. My idea might not pan out to anything, but on the
other hand, how will we know unless somebody tries to do it?

% Troposcatter is a fairly predictable
% propagation mechanism at 10 GHz (see my description of an
% experience with it on a 400+ mile path during the 1987 10 GHz terrestrial
% DX record outing in December 1987 QST) but long haul links are inherently
% lossier and less reliable than shorter LOS ones.
%   I strongly agree that we need to use our microwave resources and in

% particular 10 GHz but I think we will end up finding that for efficient
% use of our amateur resources we will start looking more like the telephone
% companies and common carrier folks when we solve the backbone problem.
%
% Glenn Elmore -N6GN- N6GN @ K3MC   glenn@n6gn.ampr.org glenne@hpnmd.hp.com

Sure, we might wind up looking like the telephone companies. Maybe they
have already tried the pulse idea. On the other hand, I have never
heard of it. If nobody has yet tried it, to see what the results are,
what is wrong with us amateurs giving it a try. It just might be
useful.

How about a 25 watt light bulb mounted in a lamp? You can subsitute a 100w
bulb for high power applications. This should please most XYL's.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

I think that this IS a ham question, and a good one at that.
"Babst TA 64837" asked if there are standards for manual coding of Morse Code. I'm not sure of what the actual standards are, but I think that the spacings are something like: a dash is three times as long as a dot; inter-character spacing is about one dash long; the space between dots and dashes within a character are about one dot long; and the inter-word spacing is about three dashes long.

Whatever, there are lots of hams who would do well to consider the effects of spacing when they send. Some of them run characters, words and groups together to the point where they're almost uncopyable. Other people sort of "mix them up" so that you get semi-words; or they vary their speed and spacing. It's amazing how much faster you can copy when the sender is going at a steady pace, and uses good spacing techniques.

I think the best senders are those with a music inclination. They seem to be able to carry the old rhythm over to the brass. Some of them get positively lyrical with their sending; they're a pleasure to QSO with.

Seems to me that I recall that the use of an autopatch to avoid local phone charges (in addition to being just plain tacky) is against phone company tariffs or FCC regs.

I once saw an article (in QST, I think) about a quartwave vertical with
ground plane fashioned to look like an old-fashioned weather vane.

Of course, flush mounted disks are nice.

What is a reasonable price to pay for a used Kenwood R-5000? Perhaps
in the neighborhood of $700 to $750. Just noticed this unit (used)
with mods for $750 in the current issue of MONITORING TIMES (in the
classifieds). Universal Radio in Reynoldsburgh, OH might be better
able to quote the going rate. The price for a used unit without
mods would be much lower. The Universal number is: 1-800-431/3939.
Ask for Jim.

And I have no vested interest in Universal. I simply find them to
be a very reliable dealer that I have had a cordial relationship
with over the years.

There is a company (name?) that makes DDR antennas for 2M, 440, etc. Mag mount
and otherwise. Very low profile, very compact, high Q. They advertise in the
ham rags. Put it in a desk drawer.

I have a *real* problem with this. About six months ago, everyone was
flaming everyone else (well, almost :-)) at the mere hint that one of us poor
hams should *dare* venture onto a police frequency with one of our
super-modified
Skysocker HT-100 handhelds to report a real emergency. Now we're finding out
that the local gendarmes are letting John Q. Public, with no training at all,
use *their* radios. Sheesh! Well, I guess it shows where the cops' *real*
priorities are.

>> By the way, your ham ticket allows you to legally operate a K band
>> radar gun. Just make sure to ID every 10 minutes :-) The X

I live in Marquette Michigan, the land that time forgot. It is not the end of the world, but you can SEE it from here.

I am NORTH of all the Canadian Population Centers. This is the Upper Peninsula of Michigan. The ARRL in 1971 on their official call area map said I am in VE3. Nope. This is 8 land, but north of the world as YOU know it.

This is an article about radio reception and transmission, and is being posted to rec.ham-radio AND rec.radio.shortwave. Followups, since they will be more technical, will be in the ham group, and I do hope for some responses to this one.

I would like to tell you about the BLACK HOLE EFFECT, a phrase I coined about 20 years ago when I was a very new ham, and a seasoned SWL. Now I am an old timer at both hobbies, have solved a lot of mysteries along the way, and would like to share my ideas on the Black Hole Effect with others on the net, and see if anyone else experiences it, or if I am the Lone Ranger....

Pertanent Details:

Marquette is at 47 degrees North Lattitude. The city is on the shore of Lake Superior, the DEEPEST Largest coldest fresh water lake on this fair planet.

Marquette is on the Mesabbe Iron Range, the LARGEST single deposit of Iron Ore on this fair planet.

Marquette is a place where WEIRD things happen with Radio Signals.

Weird Facts:

There are two Television Stations licensed to this city. Because of FAA regulations, they had to locate their transmitters to the West of Marquette County Airport, out past three Iron Mines. With rabbit ears at my location I do not get a glimmer of a hint that these stations exist. Marquette is the most heavilly TV cabled city in the USA. You have cable or you do not watch TV. EVEN THOUGH TWO stations have studios in town. With a fringe antenna on a 40 to 60 foot tower, you CAN get a signal, but it is not very good. The transmitters are not even 30 miles away.

I used to work for a 5,000 watt radio station. It was 6 miles from the city of license. We never had a decent signal in town. We were fine in Canada and Wisconsin, but in town we were the weak one. the 250 watter with its transmitter on the hiway was much louder than we were. Our antenna was in a swamp. Our ground system was superb. We just could not get out.

When I moved here, I was an active DX Listener. I loved the AM broadcast band. I found that the AM band here is about 30 to 40 DB weaker than it was in the town I moved her from. Though I am only 100 miles farther north, EVERYTHING is different. Chicago stations that boomed in on a cheapie transistor set require a communications receiver and a very good antenna to receive. BUT Very Distant Canadian stations often blast through. Also, many nights I have gotten BLASTING signals from stations in the Carribean! PJB in Bonaire, Radio Belize, and the Carribean beacon come in like locals sometimes, and during those times, NOTHING ELSE can be heard. Some nights it is only Low Power Canadian stations from Way out.

I do not have a TV antenna, but people who have them report very strange reception. One guy I know claims that he watches movies every night from Canada by hooking his TV up to a CB BEAM. On UHF no less..... We are talking HUNDREDS of miles if he is to be believed....

On HAM radio, the 20 meter band has been totally dead for over a month. I was a regular listener to the 14.313 situation, but all of a sudden, it is gone. It's not my equipment, I have FOUR receivers. They just went dead on 20 in the daytime.

Tonight on 75, I noticed that there is a regular wipeout for both transmit and receive, beginning about 9pm, and ending around 2am. I happened to be here reading the net, when some of my friends in New Hampshire were saying that they never hear me any more, so I went to try and talk with them. They all thought I was barefoot. My Henry was running 1500 watts out. No one could copy me. Then the whole gang faded right out to nothing, and it stayed that way for three hours. Slowly it all came back, and the guys were still on the air, so I came back on and we discussed the Black Hole Effect, which seems to NOT affect anyone else in that group but me. They all continue merrily chatting, and I hear them one by one get fluttery (aroural effect) and then vanish. For three hours the band is completely wiped out, and then slowly it comes back, until around 3am they are all 10 over 9 and so am I.

The theory postulated is this:

The permeability of the earth where I am at is the equivalent of living on a ferrite choke. There seems to be a breakthrough point regarding power level. When I go from 100 watts to 1000 watts, instead of the expected 10db increase, people tell me that my signal is 30 to 40db louder. This is not normal.

I seem to experience a severe aroural effect here that no one else does. The least bit of solar storm activity, and the bands dry up.

What I think is happening is that the combination of high ground absorbtion coupled with high aroura absorbtion yields signals that do not get to the other end.

I call it the black hole effect because it seems that on some frequencies, things can be received that are so far away and should be so weak that it defies logic. I can not transmit on the BCB to see if when I hear the Carribean I can not talk there, so this is only a theory, but I think it is a one way deal. I think the high ground permeability would keep my signal from getting out, while still providing some really wild receiving conditions.

I have talked with people all over the country on the air, and NO ONE else lives in a place like this. I think the combination of being so far north (Into the Aroural Zone), the Lake, the Iron Range, and who knows what else voodo, all plays a part.

A couple years ago a friend from Chicago came up here for a visit. He was flabberghasted when he found the ABYSMAL GROUND WAVE conditions (like the broadcasters up here have to live with). He was 10 miles from town before he could hear me. I was running full power on the 75 meter band. He was just barely above the noise.

BUT before you say "Gosh I could never live there"... Let me tell you a secret.

The black hole effect usually lasts only a month or so every year, though it can come at any time.

We have NO STATIC to speak of here! I talk to people all the time who are griping about their 20 over 9 static, while my S meter sits on the left side of the pin except when people talk. When we are not in a black hole situation, I can hear stations that no one else in the nationwide group can hear, simply because my noise level is so gloriously low.

In short, you could not get me to leave this place because even with its weird conditions, the fact that the only time I get static is during a local thunderstorm (it hardly rains here either)....

Winter here is just about exactly 6 months long. Almost 6 months of skiing if you are into that (I am not). BUT in the summer, the sun is out til way past 10pm. Almost 11 at summer solstice.

Is there anyone North of me on the net? (Sorry Toronto, and Montreal, you are my neighbors to the SOUTH!). I would like to know how much of this stuff is Aroural, and how much is because of the Permeability of our iron rich ground shelf.

Lets Get Technical!

Right on, Phil! A little more diagnostics wouldn't hurt much. With all
the mixed signal chips, analog interfaces to digital chips and powerful
uPs with cheap memory this would be a welcome improvment over the possible
use of those poor excuses for an S-meter called bar graphs.

I remember the days when rigs had meter switches that did a lot more than
monitor ALC and final current, even the Gonset "Communicators" had meter
(eyes for the earlier ones) switches.

I've been hearing this argument for years, and nobody has ever been able to substantiate it. While I suspect that the phone company would object, it would be no more illegal than using an HF phone patch for the same thing.

A more practical problem in doing what the original poster wanted is privacy - there is none on an autopatch. This, plus the restriction on business calls, makes the usability of an autopatch for routine personal calling pretty low.

Remote-mounted radios are a great idea. I have used a considerable range of such radios in the past, i see the advantages to be:

1) Easier to instal in modern automobiles. The control head can often go in place of the normal broadcast radio - but the hole is rarely deep enough to fit a full-size ham radio in, without redesigning the instrument panel or moving the heater/airconditioning. So stick the signal unit in the trunk where its nice and spacious, and run a control cable to the trunk.
Thats the *only* way you can do it with some gear (I used to run a 'PYE Vanguard' - a 18" by 12" by 9" 100-watt TUBE mobile rig on 2 meters...
it just would not fit anywhere except the trunk!)

2) More secure: If some jerk breaks into your car to steal the radios, he more than likely just gets the control head.
You can always buy (or build - theres only a couple of pots and channel change switches and high/low buttons) another, at less than the cost of a new radio.

3) Safer: No bulky radio on the transmission hump, for you to smash your knees agains if you have a wreck.. No 50-amp power feeds hanging about to get caught round the gearshift...

4) Neater: Fewer wires trailing about (if you do the installation properly, that is). Less equipment to climb over when trying to get into the rear seats of a two-door car (important if you have to carry children or non radio-literates who trample over your gear!)

5) Better for the radios: The trunk is usually cooler and better ventilated than the instrument panel. With good air circulation, your heatsinks will run cooler and the radio will last longer..

With some modern smaller radios, the signal unit could possibly be installed under the seat rather than in the trunk.
I think one of the ICOM ranges uses an optic-fibre to link the head to the radios (several 'band modules', one control-head!)

> Andy Greenshields [dxandy@widener.BITNET]

Andy asks for a mail response this request. However, since this question comes about once a month and BITNET mail generally fails for me, I'll post a general response here.

First, to the net in general: when asking questions, GIVE A PHONE NUMBER. Not all the readers of this group are students who can't afford to make long distance phone calls (they or their employers can afford it that is). There have been numerous questions asked that I have passed up answering because I can't afford to take the time to type out a response. This is specially so in answering technical questions, where there are many responses and the person asking did not give enough particulars.

Regarding a rig to choose: With the exception of the entry level Yaseu (757?), any new rig would fill the bill. Your best bet is to choose one that is recommended by a local ham. Find out what is in use in your local area and talk to local hams. Then make your choice. Go knock on the door of a house with visible amateur antennas. I did this to three local hams, not one turned me away, they took a stranger in and each spent several hours talking to me. I personally prefer ICOM products, but others in this area use Kenwood. The number of knobs on the pannel does not determine the goodness of the radio.

Antennas: I have spent more money on antennas and towers than I have on radios. This was good advice given to me and I pass it on to you also. Get a decent antenna. IF you have never used anything else, a vertical seems not to bad. However, unless space (or landlord) dictates otherwise get a beam. Start with a 3 element tribander if you are looking for low bucks. Get one of the smaller ones and you can put it on a TV mast and turn it with a TV rotator. Brand new for everything this will cost about $500, good shopping at flea markets (or the local hams suggested above) will provide this for $100 or so. My first TH-3jr, mast, rotator, and coax was bought ($75) from a local ham upgrading to a big tower and antenna. I used this and a borrowed rig for a year and then bought my own, used, rig. Until I got into DXing this served me well for 5 years (and 125 countries). A vertical will work for 80/75 and 40 meters, but in the long run you will be unhappy with a vertical on 20/15/10 (to the flamers, yes a vert works now. But in a year or so the sun spots will be down and then the vert just won't be any fun). A small tri-bander or any beam will require a rotator. It will also work better the higher you get it, start with a 2 section 20' TV mast on the roof. This will put the antenna at about 35' which you should look at as a minimum. To this you could add a vertical or wire antennas for 40 and 80/75 meters. 10-15 are daytime bands, 20 daytime & early evening, and 40, 80/75 are night time bands. To fill out your ability to operate all the time you will eventually need to get antennas for the "low" bands. This set up will work fine for lots of years.

Don't forget to budget accessories in your plan. If CW is in your operating plans you will need a key and/or paddles and a keyer. You will need an antenna tuner to get wires and/or the verical to work on all of the low bands. An independent (from the rig) SWR/power meter is nice (but if the rig has one, it may not be absolutely needed). You will also need to get an coax switch for selecting antennas (you WILL have more than one antenna, they are the easiest and cheapest form of experimenting you will do). To keep the rest of the family (neighobors) happy get a set of earphones, they also make it easier to contact weak stations. You will need coax (DO NOT skimp here), rotator wire, a ground rod, and some wire to run to the ground. If you don't have tools you will need moderate to heavy soldering iron (gun) and assorted hand tools to put all this stuff together. And finally, get a dummy load for testing and tuning up.

Absolutely the last thing to buy is a linear amplifier. If you have not spent as much on antennas and towers as you have the rig, you are wasting your money.

I recommend you get to know several local hams before you start. They will save you an immense amount of money besides being the first of a group of life time friends. If for no other reason that you can't put up antennas by yourself (or you shouldn't try to by yourself).

Have fun and welcome to the world of amateur radio.

regards, Dave

In article <1949@rsiatl.UUCP>, jgd@rsiatl.UUCP (John G. De Armond) writes...
>I'm a bit perplexed by this statement considering how much traffic AX.25
>moves each day even in the hostile environments like HF. If you mean that
>there are features in the AX.25 protocol that you find distasteful, then
>I agree, and we'd probably even mostly agree on what's distasteful.
>But in my book, something that works even a little bit is not "broken beyond
>repair."

No, in my book, a protocol is broken if it fails easily. Any hack will work under best-case engineering. A protocol should handle the worst case that it's used for. Thus, we're arguing semantics of "broken".

Incidentally, we have a guideline that if a protocol fails if you throw a bogon at it, it's still broken. A robust protocol ignores crud and does its best. But that's asking a bit much for now...

>You are confusing poor RF engineering with protocol deficiences. I think
>we'd all agree that most any protocol, especially any CSMA protocol will
>perform poorly on simplex networks, especially those based upon simplex
>digipeaters. On the other hand, a properly engineered full duplex RF
>environment is practically immune from collapse. I've proven that
>pretty conclusivly here on the 146.73 LAN channel.

Again, if you give it a good physical channel, even the worst protocol will often "work". AX.25 was designed for packet radio. It doesn't work reliably over _most_ packet radio. If I had a FDX repeater for packet, I'd be happier, but that's only moving the problem downwards.

I also support faster modems, etc., but I fear that appliance AX.25 with 1200 bps AFSK is a common "bundle". Both are deficient; if you're going to replace one, you might as well replace both.

>Phil's code is a very accurate duplication of the environment one finds
>in a Berkley IP environment. (And it would be an accurate model even
>if phil decides not to emulate the kernel panics :-) It works fine
>on the ethernet or on SLIP. I use it everyday for that environment....
>But when we throw this same environment onto non-sophisticated hams,
>the situation is quite different. Not only is the user interface
>alien, hard to use and cryptic, we have moved all the complexity of
>network management off a few nodes and into each ham's shack. This,
>I submit, is negative progress. Promises of future servers to address all
>problems do not aleviate the situation.

I agree that the _implementation of TCP/IP is not yet suitable for average hams. That's why the "anticomputers" should do it! The backbone should be TCP/IP, but simple/cheap (even AX.25 one hop) access should remain available for at least the time being.

Hi ---

30 days after the warranty on my IC-735 the audio all but died (you could here some audio but way down) ... I happened to live near the Bellevue facility ... and I bought a new Audio PA chip ... plugged it in and still no audio... After probing around a bit I found that

one of the capacitors on the Audio PA stage had shorted ... replaced
it and the rig has been super the last 4 years.

Just a place to look ??!!!

John

A fried of mine is looking for a Kenwood 140S or 140.

If anyone is interested in selling one in good opeating
condition, let me know.

What would a good price be for a used 140?

Does anyone have any experience with one?

I sent out a request already for any product reviews anyone
knows of.

Thanks

John Anderson

I am interested in finding possible mods for increased coverage on the Sony Air 8 especially to include the noaa wx satellites 136-138 and also above 174 Mhz. If there is anybody who knows of any mods, for this radio, please send mail to me. I have not been able to get any info on this listserv or on packet so if you know anything, please help out.

Well, its time for my semi-regular reminder about the Un-Net.

What is it? It is a time range and a set of frequencies, sort
of a place to meet.

When? "Every" saturday from 1700Z to at least 1800Z, usually I try
to shoot for 1900Z. (I decided to not move it this year when the
Dumb... er Daylight Savings Time went into effect)

Where? 28.410 MHz and/or 28.390 MHz, or thereabouts.

Who? Net-types. (i.e. YOU :-))

(Yeah, I know, this weekend is Dayton. But for those of us
NOT going to Dayton, let this serve as a reminder/invitation)

73, and don't forget to un-check into the un-net :-)   :-)

Rusty

```

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Does anyone out there (most likely in Japan) own one of these dual band
HTs? (And know if US versions are available)

Thanks,

Pete

A better way to watch/listen is via satellite TV, C band, Satcom F2R,
Transponder 13, audio 6.8 Mhz. Great live video while near/over the
continental USA. Quite enjoyable.

Anyone know if the Bravo pager is frequency programable? I also would like to know what goodies are needed to reprogram the cap codes. I would like to have a second display pager on my same "phone number" for my XYL. Any good cheap sources for a pager setup for operation on 931.875 Mhz? My local pager service wants $200.00 to replace a lost/stolen unit. Thanks for any info...

This is a continuation of an article I posted last night. I am writing this right during another BLACK HOLE INCIDENT.

I was talking to KI2J in New Hampshire, as well as other stations along the East. Everyone had strong signals. Freq 3950khz on 75m, 0400z.

Right during one of my transmissions, everything changed. When I turned it back to KI2J, he said that I had gone from 20 over 9 down to an S-7, He was already down to about S-4, and soon I could no longer hear him.

I tried to tell him that I was in the middle of another of the Famous Marquette Michigan Black Hole Events, but communication ceased.

So I decided to check something. I came down to the computer room, and put up GEOCLOCK, which makes a nice world map with a display of the sun and shadow, much like the GREYLINE ADVANTAGE (IMHO, GEOCLOCK IS SUPERIOR because of all the MAPS you can get for it for detailed info).

Now I notice something very interesting. The effect is most pronounced when the sun is exactly on the opposite side of the earth from me. It starts an hour or so before I am at maximum darkness, which tonight occured around 1:14 AM. The event is still occuring now, and I am monitoring the frequency, and I can hear (barely) several stations in conversation, and they certainly are not experiencing this effect at all. It is obviously aroural, though I still suspect that the Ground Permeability is also a factor. Just why NO OTHER station in the group has NO HINT OF THE EFFECT is somewhat interesting. I do not think that Just because I am the furthest north is the only factor. KI2J is at 44 degrees north, right on the New Hampshire border. I am at 47 degrees north. Three degrees should not make such a substantial difference.

The stations I hear on frequency at the moment are all sounding as if they are at the end of a long tunnel, or a leslie organ speaker. Rotating and echoey signals which are barely copyable. BUT they all hear one another just fine.

This is indeed exceedingly weird.

Usually I experience it in the winter, this is the latest into the spring I remember the effect.

Any other Late Night 75m ops to compare notes with???????

Anyone here from, say Finland? I have worked some really great over the pole stuff during these things down in the DX window....

In article <24281@usc.edu> kjh@pollux.usc.edu (Kenneth J. Hendrickson) writes:
>Sure, we might wind up looking like the telephone companies. Maybe they
>have already tried the pulse idea. On the other hand, I have never
>heard of it.

For what it is worth, I remember reading that one of the very first operational microwave relay systems, in service late in World War II or just after, was based on magnetron generated pulses. It time division multiplexed something like 8 voice channels onto one RF channel by using pulse position (or pulse delay) modulation. I seem to remember reading that it was used to establish a telephone link across the Rhine for use by the US occupation forces. The author of the article I read considered this to be the first non-experimental use of microwave technology to relay telephone traffic.

It seems to me that the peak-envelope-power limit now in effect limits the attractiveness of pulse techniques, since one can no longer legally fire up that old radar magnetron with 1 megawatt peak envelope power and radiate hundreds of watts average power in .05% duty cycle pulses with real PEP wallop.

Aside from the conveniance of using ancient radar technology to generate high power pulses easily, pulse techniques have little to offer in performance relative to CW modulations such as FSK, PSK etc. because the energy in a fast pulse is spread out over a wide bandwidth. A simple receiver attempting to recover intelligence in a low duty cycle pulse stream must either have a wide bandwidth relative to the bit (pulse) rate that lets in a lot of noise, or use a narrower bandwidth that excludes a significant fraction of the energy contained in the signal. This is not particularly optimum by comparision with

modulations that concentrate their energy in a narrow bandwidth relative
to the baud rate allowing IF filters to exclude more noise.

Subject: New Versions MacIntosh Ham Stacks
Message-ID: <35852@genrad.UUCP>
Date: 26 Apr 90 12:28:50 GMT
Sender: news@genrad.UUCP

Lines: 57
Posted: Thu Apr 26 13:28:50 1990

It's been a long time since I last posted anything about these stacks, so I'll refresh your memories about what they are first:

I've created 5 HyperCard MacIntosh Stacks which are helpful for practicing taking the Written tests. There is one stack each for Novice, Technician, General, Advanced, and Amateur Extra written tests. Each stack contains the entire question pool supplied by ARRL and will create a randomly generated test of the correct number of questions (like 30 for Novice) and of the correct number of questions from each section. The tests are interactive and CAN tell you immediately if you get the question wrong, and they will also give you a score afterwards, plus allow you to review the questions that you missed.

I've given away about 50 copies of these stacks already, and they are still available, although now, I must request a Self-Addressed Stamped Envelope, plus blank 800K diskette if you wish me to send a copy (I have no more blank diskettes to give away). Alternately, the Ham Stacks are maintained on a couple of systems via anonymous FTP, although I do not support this. I have no access to any system that allows this. Two places you might look for them are on tank.uchicago.edu, or on Patty Winter's system (don't know the name of the system, Sorry!). They are also available thru a couple of MacIntosh Ham diskette exchanges, one in Austin, Texas, one in Manchester, NH.

I have updated the Novice Stack and the Extra Stack and will be sending them shortly to Patty. The Novice Stack has some minor typos fixed, plus I've added a capability to PRINT the results of the test, for use as official scores. We have in fact used this method for 2 of our last Novice class, when we ran out of written tests. Obviously, this method is not useful for anything other than Novice, since higher classes require that you use Three VEs, so I haven't added this functionality to any of the other Stacks. The Extra Stack has some typos fixed, and a couple of other more major bugs fixed.

Another question that continually pops up is if these files can be ported to a computer other than MacIntoshes. I'm sure they could, especially since HyperCard (or a similar program) is now available on PCs......but I don't have any access to any other computer, so I can't provide anything but 3 1/2" floppy diskettes, used by Macs.

If you wish a copy of these from me, please send SASE and Diskette to:

Is it more advantageous to sell a used Kenwood R5000 or trade it
for another new rig?  Any advice on dealers who give good prices
for trades/buyings, or is better to sell a used rig privately?

Are there any ICOM experts out there who know of modifications to the model 490A to expand its frequency coverage? This is an all mode designed to cover 430 to 440. I would be interested in knowing if it can be made to work up into the 440 to 450 range.

Thanks

Steve Dakin WQ5N

Heard the astronauts direct during their EVA during deployment of the HST.

Heard between 7:15 and 7:30AM MST during their pass over the western US. Space suits are on 279.0 MHz AM. Receiver was an Icom R-7000 with a 1/4 wave groundplane at 15ft.

I don't know if it was mentioned yet, but 73 magazine had an article on how to convert a microwave oven to a transmitter, about 250 watts I think, several months ago. It was in their annual microwave issue.

73,
Michael

Has anybody purchased the RCA APT terminal advertised in the last 73 magazine? This is supposed to be a good cheap terminal for packet type use. It has video and RF outputs, RS-232, parallel printer port, built in modem, etc. I would like to get one of these if they are any good. Please let me know if you have any experience with these. Thanks.

73,
Michael

If you are just looking for replacement resonators for your Hustler antenna, almost every good ham store carries them. Check any of the ads for AES or any other ham outlet and call their 800 number. You'll probably get faster and cheaper response than directly from the factory.

(This is assuming of course, that you just want to buy a new one and not trying for warranty type replacement.)

RF Design is one of those trade journals which is FREE (i.e., paid for by advertizers) if you give them a company address and tell them you are an engineer who buys items listed on the subscription form. In the context of such publications, it's very good-- It has real aritcles among the ads disguised as such. The editor is a ham!
The address for subscriptions is:

You are assuming several things that were not stated. For openers, you are assuming the original report is true. Personally, I tend to doubt it. It just doesn't sound like the sort of thing the responsiblle professionals I have had contct with would do.

Next, you are assuming that the radios were on a primary "hotshot" tactical frequency rather some secondary frequency normally used for non-emergency purposes.

Finally, you are assuming that these volunteers indeed received no training. Again, I tend to doubt those things were passed out willy-nilly.

When I used to live in Thunder Bay, Ontario, Canada, I used to get wierd skip/radio/etc conditions also. As a kid I would listen to the big 89 (890 AM) WLS Chicago very late at night on a transistor radio. In fact Thunder Bay used to get some of its T.V. reception from Marquette, Mich. I recall a program called 'Creature Features' that used to come on at 1 AM, the reception was always pot luck; sometimes you'd get a snowstorm on the screen, sometimes not.

BTW, the calls letters I used to use were VE3-SWC (I believe), which were the call letters of my high school. Try pointing your beam north west (yes, Thunder Bay IS north of you) some time, there are a lot of Hams back home. Best of luck to you!

Regards, David Berezowski

I am sure they don't use the same frequency that the regular police use,
but rather they use an idle "special events" or "special duty" frequency.

This cannot be, by itself, an important factor.   Much of Europe is
north of 47 degrees. I think Bern, Switzerland, is at about 47 degrees.
Even Bolzano, in Northern Italy, must be very close to that.
I lived in Brussels for a while (north of 50 degrees) and never noticed
the kind of phenomena you describe.

I don't know if this is a sign of the times or not....

In Toledo, Ohio, Marko Electronics has gone into bankruptcy. Marko was famous during the period of peak popularity of CB as the leading supplier of illegal amplifiers and the place to take your radios for out-of-band mods.

One school of thought is that the "outlaw" period in CB history is over. The other is that with the easy availability of general coverage modified ham gear in general and the Uniden/RS 10 meter radios in particular there is not enough market to sustain specialized "outlaw" shops.

What do you guys think?

If you go to Michigan Tech Univ, which is 100 miles west of Marquette, you can get a postcard in any book store with a road & a signpost which says something to the effect: "Houghton - 5 miles, "End of the world- 15 miles"

Seriously, the enormous amount of copper and iron in the "Copper Country" would well be the reason for this weird behaviour. I used to receive AM stations as far south as Louisiana and as far east as Boston regularly. Also I didn't notice this effect you talked about on any of the Ham bands. Of course I wasn't that much into the hobby then either.

% up. Do such frequencies require methods that are very different from
% 24 GHz systems?
% --Aryeh Weiss (4X/KA1PB)

A better person to answer this would be Tom Hill wa3rmx, because he's already got working equipment on 47 GHz. However, I don't think the techniques and methods necessary between 24 GHz and 240 GHz are a whole bunch different than between 2.3 GHz and 24 GHz. Parts are a

whole lot more difficult to find, and they are of course a whole lot
smaller.

If you're thinking about building something in that frequency range, I
would probably recommend that you attempt 47 GHz or 76 GHz so that you
will be able to procure parts. Good Luck. 73

This is not true! Distances greater than this have been worked on all
bands up to and including 23 cm. I don't know the current world
distance records above 23 cm, so distances greater than this may have
been accomplished on the higher bands also.

Wanted:-Identification or information on a

Technical Material Corporation Receiver

This was a rack mount (3 rack units(5.25inch)) receiver built for the Navy or Air Force (US). It appears to have been built in the late 50's early 60's era due to the exclusive use of 7/9 pin tubes (no transistors or even germanium diodes). It accepted four plug-in modules to cover the freq range of 2-30mHz. I believe a special adaptor could be attached as a companion for the reception of SSB.

Many thanks.   Daniel Blakley

Have you tried to talk to someone in northern Alaska, like Anchorage or Fairbanks? How about extreme-northern Europe like Norway? Maybe if you can't get in touch with a Canadian in the Northern Territories, you can reach these people. There are alot of northern Alaska amateurs on these days, IMHO. Try them. 73's, Mike

Try a J-pole made of twinlead. It's 5' tall, and virtuall disappears if
you use the clear variety. Send e-mail for more info.

If you can hide the matching network, other varieties of end-fed
half-wave antennas work, too.

The only FCC reg this might violate is the one on "Good Amateur Practice".
The fear is that if we continually abuse autopatch privileges to avoid
telephone toll charges, this might lead to FCC instituting legal restrictions
(or prohibition) of autopatch use.

Regarding antenna gain/aperture at 23 cm.

For a given antenna type (dipole, say), the aperture is proportional to the square of the wavelength. If you have 100 dB of path loss between two 144 MHz quarter-wave ground planes, you will have 120 dB of path loss between two 1440 MHz ground planes the same distance apart.

On the other hand, you probably wouldn't use a ground plane at 1440 MHz. If you built a dish antenna the same approximate size as the 2 meter ground plane, you might have 20 dB LESS path loss (80 dB total).

If you compare antennas of the same TYPE, lower frequency is better.
If you compare antennas of the same SIZE, higher frequency is better.

Radios/Selling vs. Trading

It has been my experience that you GAIN by selling outright rather
than trading.  The dealer --as you well understand-- makes a profit
when your trade is resold.  I was once offered $150 for the FRG-7
on a trade.  In just a few days I was able to sell the FRG for $250.

I am an active Mac enthusiast who wants to get into the telecommunications
aspect of Ham.  Can someone recommend a source for info on using
Macs w/ ham radios?  I'd like to know what kind of hardware and software
I need.
   Is there a book which discusses ham & Mac usage?
Also, of the mail-order companies, which one has the best support for
Macintosh interfaces and software?
                                  Thanks,
                                            Andy

Well, does Houghton/Hancock count? (For those who don't know The towns of Houghton and Hancock are about 120 miles west of Marquette). I went to school at Mich. Tech. Univ. until 1983. You are right about some of the wierd local phenomena that occurs. It was the only place where I saw Northern Lights with distinct colors. Canadian TV from across the lake is crystal clear (with a roof antenna), but the Marquette repeater 30 miles away was nothing but snow. Wisconsin TV stations about the same distance as Canada and across the lake but in another direction where usually hopeless, but would sometimes come in crystal clear. I had a roommate who like to listen to late night AM broadcasts on a pocket radio. He used to get great reception of Boston (WXYZ, I believe) and some New York City stations, as well as the occasional Bermuda or Texas station. All from a generic pocket radio.

By the way, why the reference to Finland? Don't you speak the language by now? I thought that Marquette was the only WWUP-TV station was the only television that broadcasts finish language shows on a weekly basis. I have a net.pen pal that lives in Finland, if you want I can send you his net.address.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Well first of all 47 Degrees is not all that far North. It is about the same latitude as Nantes France. It is south of London, Berlin, Copenhagen, Warsaw, Den Hague (That's enough dreary capitals -Ed). But the question I suppose should really be, how far North is it from the "Magnetic Equator." I dimly recall that a stations position relative to the magnetic equator is important vis-a-vis Aurora and HF propagation.

But first, lets assume that Marquette is in Aurora Country and is also sitting on top of a fair amount of iron ore. There is a similar location in Sweden. The world's "largest city" (in square kilometers of desolate Tundra) is Kiruna. It is also an enormous iron mine. Hams there should experience the same phenomenon as Gary.

I remember in the seventies hearing a second hand story that DX was pretty bad off the Southern Tip of Sweden (Ystad, Trelleborg) because there were massive Iron deposits just offshore. The story involved not getting out and not hearing too well. Southern Sweden does get a few Auroras also.

No good answers I'm afraid, but certainly some points of reference and comparison. All we need now is a report from Kiruna.

Note: Marquette is about 47 degs North, Helsinki - 60 degs North and Kiruna - 68 degs North.

Organization: University of York, Dept. of Computer Science
Subject: PRO-57

In a recent article, fluke!limey (Paul Limey KW7Y) asked:

> Does anyone have mods to the Realistic PRO-57 to fill
> in the missing frequencies? Does anyone have a schematic for
> same?

This is perhaps not exactly what Paul Limey was asking for, but:

I have successfully modified a PRO-57 for computer control. The modification entails the addition of one chip (a multiplexer), a few resistors, and a diode, all of which fit on a small piece of Veroboard inside the box. The receiver is connected, via a 9-way plug & socket & ribbon cable, to a separate interface box, from where an RS-232 link goes to the controlling computer (a Sun 3/50 workstation). The mod. is designed so that the PRO-57 can be used as normal (i.e. without the computer) when the interface box is not plugged in.

Details on request.

Why is a pulse easily detectable? If you are listening via a narrow time window IN PROPER SYNC then you will get a S/N advantage. Once syou start defining addition pulse times to listen on, or widen the period you have to listen, you lose S/N advantage.

You have to have a wideband system to allow receiving the full peak of the pulse since its power is distributed in the frequency domain. Of course if you know the period you can selectively listen to parts of that spectrum where the signal would be found (a comb filter). Then again, you don't need pulse to apply that technique.

> No, I don't have a 10 GHz pulse source, but they are available. Now if
> we could only use them legally ...

No one has petitioned the FCC yet.

For a limited time, the call sign data base files are online for anonymous FTP access. The host is "vmd.cso.uiuc.edu" (128.174.5.98) and the directory is "phil.514". You MUST use binary/image mode to access the files. They are compressed with UNIX compress. There are 260 files, one for each possible combination of call sign number with letter following it and are named by that method.

I have been an RF Design subscriber since high school. For many years I listed my occupation as student but got it free anyway. Another freebie is Microwave Journal (685 Canton St., Norwood, MA 02062) but it will only depress you when you see how far from the state of the art that amateur microwave is. Commercial microwave, at least up to 30 GHz or so is pretty much by the numbers: calculate link budget, buy modules, hook them together and you're done.

There are literally hundreds of these free trade journals out there. I personally receive at least a dozen in the electronics field. Most (all?) have "bingo" cards for obtaining free information from manufacturers.

>Why is a pulse easily detectable?

Because it has such a high peak power.

>Once syou start defining addition pulse times to listen on, or widen
>the period you have to listen, you lose S/N advantage.

I disagree. Since the pulse is of such high power, a much greater path loss can be overcome. Listen 100% of the time, and the strong pulses that are much greater than the background noise level will be easily detectable.

then writes:
  This is not true! Distances greater than this have been worked on all bands up to and including 23 cm. I don't know the current world distance records above 23 cm, so distances greater than this may have been accomplished on the higher bands also.

Don't be fooled. There is a LOT of difference between setting a distance record and having fairly predictable and reliable communication. With a kilowatt, and BIG ham antennas, you might expect 600 km or a bit more on VHF bands by tropo scatter. On six meters, people consistently work 2000 km by ionospheric scatter, again with a kilowatt and big antennas. But the distance cut-off is pretty sharp, since it is a lower-E-layer phenomenon and both ends of the link must be able to see a common point in the E layer. Iono scatter works better on ten, but hardly anyone uses it since other modes are enough to keep them interested.

No, you'll have to use the HF bands, and even ten is marginal from here (Washington DC) to Texas on many days.

I attribute the change of interference level with picture brightness to a change in the BEAM CURRENT of the CRT. Thus the HV lead may well radiate, though the picture-tube-cone capacitance might help reduce this a lot.
I certainly hear my computer a lot louder when the screen is full of text rather than just a simple C> in the upper left corner.

Just a thought.

Mininec2 does indeed live on WSMR-SIMTEL20. You can find it in:

```
    PD1:<MSDOS.HAMRADIO>MININEC3.ARC
```

It is 158,720 bytes long. However! The request was for a source of NEC, which is the grandfather as it were of mininec.

Mininec is, to say the least, user hostile. It is also written in BASIC. NEC, was written in FORTRAN.

If you want mininec3, you might try anonymous FTP. I have never had any luck--either loose the link, or am told "too many annonymous users" and get blown away. So, I use listserv(e). To make good use of this, you need to be able to uudecode files. To get mininec3, I would type:

```
            Mail listserv@vm1.nodak.edu (there are other servers around)
SUBJECT:    (Leave Blank)
(Text Here) /pdget mail pd1:<msdos.hamradio>mininec3.arc uuencode
```

This gets the file mininec3.arc sent to me as pseudo ASCCI email in about 40k chunks. To get a useful file, I needed to combine all of these mail chunks--eight or nine of them, as I recall, remove the mail header and trailers--creating a bodacious mininec3.uue file--then move this to my PC. I then run the uudecode program--mininec3.uue goes in, mininec3.arc comes out. Run your favorite unarcing program to get the run files.

This works fine for those of us using ms-dos machines. Anyone out there want to give access directions for other (non-MS-DOS) partitions on SIMTEL20?

Well it is nice to hear from someone up there. I was in Houghton which is a few 'minutes' in latitude higher than Marquette. The joke around town is a postcard with a picture of a snow covered road and a signpost that reads something like "Houghton 5 miles, End of the World (Earth) 12 miles".

However, with regard to the original question, I did not notice any such problems with reception in the Keeweenaw Peninsula of the Copper Country although there were substantial iron and copper ore deposits in that region. The AM bands were quite decent with MW stations from Louisana and Massachussetts coming in quite well. The HAM bands were also quite normal compared to what I get here in Texas now.

"Houghton 250" snow average/year and 6-7 months of snow on the ground!"

This is my second attempt at posting this, excuse me if you saw this before.

I believe pulse has no inherent signal-to-noise advantage over narrowband techniques. Yes, the peak power is much higher, but so is the bandwidth. Since noise is proportional to bandwidth, it comes out a wash.

The advantage of pulse at microwave frequencies is that frequency stability is much less important than with narrowband modes. Stability is harder to achieve the higher you go in frequency.

Once again, Morse code spacing:

Dit : 1 unit
Dah : 3 units
Space between dit's/dah's : 3 units
Space between words : 7 units

Note that the word "PARIS", including the 7-unit space at the end, is exactly 1 standard "word" long.

Time for me to make my semi-regular announcement :-)

Anyone needing something like the above, I've got about 3 different versions of morse code programs. (The list is at home, so I don't know exactly which ones they are, sorry)

In any case, I'll glady copy the ones I can legally send onto a disk, if you will send me the disk, return postage, and a return address label.
Oh, yes, I'll mail it back to you, too :-)

I can write 1.2 meg, 1.4 meg, 720k, and 360k disks. Please send PREFORMATTED disks.

Hope this helps!

Well, that sounds vaguely like something I once said but I can't remember either.

Be careful about terms here since there is a popular misconception about pathloss that goes something like "something magical and dreadful happens above 1 GHz or so and energy is no longer conserved which is what accounts for microwaves not being good for anything". Efficiency sometimes gets used to relate to the subject of how much of the transmitted power going in at the connector actually gets turned into useful radiated energy. Lossy elements within the antenna structure or local environment(ground losses etc) decrease this. People also talk about "aperture efficency" which relates to how good a job an antenna does (on receive) of "catching" all the incident power from some distant source or (on transmit) of creating local fields which all contribute to the production of the theoretical maximum fields at a distant measurement location.

Although skin effect or other losses may not scale with frequency there is no general *frequency* term related to the inherent ability of an antenna to translate transmitter power to radiated fields. There is nothing fundamental preventing a dipole (or any antenna of constant *electrical* description for that matter) from generating the same farfield power at 10 GHz as at 100 MHz. 1 watt into a an isotropic antenna spreads out to become the same intensity on the surface of the encompassing sphere of radius D(istance). Adding up all the power over the surface of that sphere gets you back to the original power you put into the antenna (minus any that got lost heating up the copper, dandilions or whatever).

Al N1AL writes:
>
> On the other hand, you probably wouldn't use a ground plane at 1440 MHz.
> If you built a dish antenna the same approximate size as the 2 meter
> ground plane, you might have 20 dB LESS path loss (80 dB total).
>
> If you compare antennas of the same TYPE, lower frequency is better.
> If you compare antennas of the same SIZE, higher frequency is better.

Al correctly identifies the rub: The *physical* size of an antenna of given *electrical* description is decreasing with frequency. That is, the *physical* aperture (how big a "flux catching bucket" the antenna represents) of an antenna is changing at -20*log(freq). This means that if you compare the end to end performance on a freespace path using constant electrical size, say two dipoles or two isotropic antennas, it looks like there is indeed some kind of "pathloss". However, energy is conserved (I know we are all breathing easier now) and what is really happening is that the receive antenna physical aperture is shrinking with frequency. Consequently if you go out a constant physical distance from the transmitter and see how much you catch you discover lower frequencies appear to work better. Don't believe that! It's just that your antennas are getting smaller. Or put another way, you went a greater *electrical* distance at higher frequencies.

To further compound the misconception, the physical aperture of electrically small antennas (dipoles and other low gain structures) can be much greater than their physical size. This accounts for pocket transitor radios with loopsticks working as well as they do. Although they are physically small they electrically have virtually the same aperture (bucket size) as a dipole, I forget the difference but it is fractions of a dB or so. They may be miserable to feed due to their extremely high Q and resultant inefficiency given real world matching networks (160 Meter mobile antenna problem) but they do a fine job to the degree that one can couple to their radiation resistance. This situation furthers the myth that low frequencies are better; physically small antennas don't seem to be the same. A rubber ducky on 10 Meters (do they exist?) appears to work better than the same length full size monopole on some much higher frequency.

Once one gets away from the somewhat confusing lowgain/simple antenna situation things do become more obvious. For a constant ERP (constant tx power into constant gain antenna) you get constant flux at distant receiver site independent of frequency. Putting up a constant physical size receive antenna results in recovering the same power, independent of frequency. However that receive antenna's directivity and gain (directivity~gain if there isn't some frequency dependent loss problem) is increasing with frequency. Therefore for the constant *electrical* size transmit antenna (dipole, 5 element yagi, 100 lambda diameter dish or whatever) and constant *physical* receive antenna size there is constant "pathloss", "pathloss" in quotes because no energy is really lost on the path itself. No frequency dependency or deterioration would be noted.

But wait! We aren't done yet. The real world often(usually?) has us use the same antenna for transmit as for receive. If we let *both* ends be constant physical size (actually constant physical aperture but I'm talking about higher gain antennas so the two are roughly the same now) our ERP is increasing with frequency along with the gain (or electrical aperture) and we are increasing the flux at the distant receive "bucket". Since electrical aperture goes as lambda^2 this is a +20*log(frequency) dependency.
This makes higher frequencies look *better*, as Al mentioned. A given physical size antenna focusses the transmitter power better on the distant receive site as frequency is increased. We end up wasting less of it in directions where we are not collecting/receiving it (for point to point communications).

Summary:

Constant electrical size on both ends (as in omni-omni links) gives -20*log(frequency) performance. Things get worse with increasing frequency. In addition physically short antennas can (nearly) behave as though they were full size dipoles exagerating the perceived effect.

constant electrical/constant physical size antennas on a link has no frequency dependency. The transmitter creates constant flux/meter^2 and the constant physical size receive antenna catches the same amount, independent of frequency. This might be an omni/directional antenna link.

Constant physical size on both ends (directional/gain antennas on a full pt-pt link) gives +20*log(frequency) performance.
Higher frequencies allow focussing more of the absolute

transmitter power on the remote receive antenna as frequency is increased. This effect continues until real world constraints like water vapor absorption or beam de-steering by troposhperic conditions diminish it.

This is the crux of the argument for going to a network of point-point physical layer links as we try to build a moderate/high speed amateur digital network. Not only do we have to use higher frequencies to efficiently transmit our bits, we have to go higher to find spectrum in which to do it. Both of these reasons are vital as we try to provide high bandwidth information (high rate, low latency and high volume) simultaneously to a large number of users.

The physics, economics and politics of the situation all demand this.

Another advantage is (was anyway) the higher average power hardware available through surplus (cheap) radar hardware. I think that issue is rapidly disappearing.

Just locate the nearest Radio Shack store and I'm sure the salesman could explain the advantages and operating procedures. Generally, they are not very expensive; 50 to 150 dollars. I believe a good one could be purchased for $70. The antenna will run another 20 to 30 dollars. I would suggest just getting a "magnetic mount" type that will stick to the surface of the trunk lid or roof and run the coax cable in through either the trunk or through the window.

Best of luck

> >Why is a pulse easily detectable?
>
> Because it has such a high peak power.

...yeah, ...if the way you are listening happens to be peak sensitive. A "peak" can also exist in many other forms (domains) such as spectral (i.e. an unmodulated or low baud rate CW carrier). What you are talking about is concentration in the time domain only. There are other domains from the simple spectrum domain, to more complex domains involving spread spectrum.

Regardless of where you put the signal, provided you put it somewhere that it can be picked up, you only have so much signal compared to a certain amount of noise. OLDER technology allowed "filtering" out noise in the TIME domain rather easily by closing the receiver at times the pulse is not expected. Today, we can do this in virtually ALL imaginable domains. Shannon's law applies to them all. Pulse just happens to be cheaper using older technologies.

> >Once syou start defining addition pulse times to listen on, or widen the period you have to listen, you lose S/N advantage.
>
> I disagree. Since the pulse is of such high power, a much greater path loss can be overcome. Listen 100% of the time, and the strong pulses that are much greater than the background noise level will be easily detectable.

You can overcome the same path loss by many methods. Suppose your system is marginally working, and the path loss increases by 3 db. You could increase the POWER by 3db and overcome it. You could DECREASE THE BAUD rate to 1/2 and overcome it (changes needed at the receiver to narrow the bandpass to gain the advantage). Other methods can be used in other domains.

We are talking about theory and practicality. The ONLY advantage I see to pulse is that much pulse equipment is available to hams cheaply. It is not inherintly better in terms of noise immunity. Given than hams are limited to a peak of 1500 watts, pulse has a DISadvantage of actually REDUCING your average power. Of course that disadvantage might be gained back if you are trying to drive the signal through an amplifier that can handle only an AVERAGE of 15 watts for dissapation purposes for your 1% pulse.

Pulse has practical advantages in certain cases, but it has NO THEORETICAL advantage.

This might apply to receiver and not transmitter. I'll have to think
about it for some time (and consult with KE9TV) to be sure I have all
the variables considered.

I suspect that if you scale down the whole system, transmitter, receiver,
wavelength, AND THE PATH LENGTH, you would have a constant signal strength
or perhaps a constan S/N. Of course reality does not allow us to scale
everything any way we want, such as path length.

I am in need of parts for Bearcat scanners. One is the CPU chip for the Bearcat 300. Also chips for Bearcat 250's. In particular, the UHF chips (at least this time around).

Did anyone buy up any of Bearcat's surplus?

I can't believe I did this. Attribute the typo to lack of sleep.

The correct spacings for Morse code are:

Dit : 1 unit
Dah : 3 units
Space between dit's/dah's : 1 unit
Space between letters : 3 units
Space between words : 7 units

Note that the word "PARIS", including the 7-unit space at the end, is exactly 1 standard "word" long.

This applies to a system including transmitter, receiver, and similar antennas at both ends. As frequency is changed, receiver noise figure, transmitter power, and path length should not change.

>I suspect that if you scale down the whole system, transmitter, receiver,
>wavelength, AND THE PATH LENGTH, you would have a constant signal strength

This is not true. As the antennas stay the same size, antenna SYSTEM gain goes up as f^4 (because the antennas at each end have gain that goes up as f^2) but the path loss only goes down as f^3. Thus, for antennas of the same size, there is an advantage to going to higher frequencies.

For antennas of the same type, lower frequency is better for two reasons. (1) the antennas get physically larger, and (2) for higher frequencies, the antennas get very difficult to build. Just try to build a yagi on 3 cm!

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Does anyone have information about the fate of Teletext services in the US? This is an information service that provides text and block color graphics capability on a home TV receiver equipped with a special decoder. The data is embedded in several unused TV lines in the vertical blanking interval. The data repeats over and over in the form of a magazine. The decoder simply grabs pages as they come by and stores them in a display buffer. The system is very popular in the UK.

Zenith used to offer an embedded decoder on some of their sets. Also, Dick Smith electronics offered a kit a few years back.

Observations on several local broadcast and cable channels show considerable activity in the blanking interval.

Information on current status of Teletext and sources for decoders would be appreciated.

!! HELP !!

For about one year I'm looking for information on the computer interface of the AR-2002 communications receiver.

If someone has hard- or software information about this interface (or also about other interesting aspects of this equipment) please send it to me by email to

schot@dutentb.tudelft.nl

or on paper to:

C.A. Schot,
Grote Kreek 45,
3079 CC Rotterdam,
The Netherlands.

Even the name and address of the (I thought Japanese) manufacturer of this scanner can help me.

Please, help me, because this is the last hope for me to get this information.

I don't remember anything in the original posting that said the requestor was trying to beat the toll charges. It just so happens that the person who sent the original request is a Midshipman at the Naval Academy, and he is not likely to have a phone in his room nor can he run out and look for an available phone booth any time he wants. Being as running phone patches for the military, especially ships at sea, is something hams have

always bragged about, I can't understand why everyone is up in arms about
this poor guys request.

And just as a matter of information, I once knew of a repeater that was
set up primarily as a means of avoiding toll charges. It was set up in
a location where it could have a phone number that was in an exchange that
would normally be a toll call for the group who comprised the regular users
of the repeater.   I don't know of anyone ever getting a pink slip for using
it.

Hi,

i have heard some rumours about undocumented keyboard (service) functions of the
AOR-3000 communications receiver.
Does anybody know something about this ?

Where can I get hints for descrambling Pay TV programs, e.g. the German
"TeleClub" system ?
Can anybody recommend me literature or any other kind of information ?

                   Thanks in advance

P.S.: For those who don't know:
      The AOR-3000 is a   100 kHz to 2036 MHz   (continuously, 50 Hz steps)

Communications Receiver with N-FM / W-FM / AM / LSB / USB / CW modes
and 4 x 100 memories
... and a RS-232C interface.
(I hope to find the time to write & post controller software for it!)

One way to implement the audio phase difference for the phasing method of SSB generation is described in _The_ARRL_Handbook_ and in Horowitz and Hill's _The_Art_of_Electronics_ 2nd ed. page 295. They call it a phase-sequence filter and it consists of a cyclic network of resistors and capacitors, driven by two signals of 180 degree phase difference, producing four outputs 90 degrees apart. Does anyone here have any experience with these filters? In particular, how are they designed and analyzed? References?

Thanks,
Bob Kelley

But can you explain why the case I cited is incorrect as you say without giving as an example some entirely different case? I was not talking about the case of antennas of the same size.

As the antenna scales with wavelength, it's gain is constant. The path length is also scaled meaning the path loss is less by f^2 but the receive aperture is less also by f^2. Still seems constant to me.

Does anyone out there have the stats for the new IC-970?
I just saw an add, but it wasn't very complete. Does anyone know
the power specs etc...and has anyone ever used one??Or is it still too
relativly new.

Also, has anyone out there got an IC2400? If so, how good are they in
the practical world?

Dave

SpaceNews

MONDAY APRIL 30, 1990

SpaceNews is published and distributed weekly around the world on USENET and Amateur Packet Radio. It is available for unlimited distribution.

* STS-31 NEWS *

Mike (WD8KPZ) of Phoenix, Arizona reported hearing space shuttle astronaut communications on a frequency of 279.000 MHz AM during their EVA during the deployment of the Hubble Space Telescope.

Mike used an Icom R-7000 receiver and a quarter-wave ground plane antenna at an altitude of 15 feet to receive the astronauts.

* STS-35 NEWS *

The STS-35 Astro-1/SAREX mission launch date has been delayed from May 9 to May 15 due to the STS-31 launch delay. There may be a further delay due to a presently unhealthy STS-35 astronaut.

* DOVE-1 NEWS *

Bob (N4HY) continues to upload software to the DOVE-1 satellite in an effort to bring it back "on line" after the OBC crash last month. DOVE-1 is presently transmitting on 2401.100 MHz (+/- Doppler!) while the 145.825 MHz general beacon is turned off. DOVE-1 will be back on VHF in a short while carrying digitized voice messages of world peace.

* COMET AUSTIN NEWS *
=====================

Comet Austin (1989c1) has been sighted by many living on the west coast of the United States in recent weeks. Comments from observers indicate that the comet was not as spectacular as expected and there are indications that the comet's brillance will decrease further now that it is receding from the sun.

* CONSORT-3 LAUNCH *
====================

The launch of Consort 3, a commercial suborbital rocket carrying 12 microgravity experiments, has been set for May 17 at 10:40 AM EDT (1440 UTC), by the University of Alabama-Huntsville's (UAH) Consortium for Materials Development in Space (CMDS), a NASA Center for the Commerical Development of Space (CCDS).

Consort 3 will be launched from the Naval Ordnance Missile Test Station facilities at the U.S. Army's White Sands Missile Range (WSMR), New Mexico, by Space Services, Inc., Houston, using its Starfire rocket. The rocket will carry the payload to an altitude of 200 miles and will provide the experiments with 7 to 8 minutes of microgravity time.

* MIR NEWS *
============

After numerous postponments, the 20 ton "Kristall" Mir expansion module is expected to dock with Mir on June 1, 1990. Software problems on board Mir are responsible for the delay. The module was orginally scheduled for launch in February. Cosmonauts Anatoly Solovyov and Alexander Baladin have been living on the Mir space station for 77 days.

* SPACE FOR PEACE *
===================

The European Space Agency and the Soviet Union have signed a ten-year agreement to cooperate on exploration and use of space for "peaceful purposes". Space Fax Daily reports the agreement was signed on April 23rd in Paris. There will be no exchange of funds under the pact which has the option to be renewed for an additional decade.

Subject: Greetings.

Hi John,
This is just a note to say thank you for the SpaceNews articles you write and a wish for you to continue.

I receive your articles both by the Packet Radio Network and the Fidonet. (I believe they originate on the Internet but I haven't seen that newsgroup here yet.)

Thanks again.

Carl.

Our radio club is contemplating another remote receiver for our 220 repeater system. Our main intention is to compliment the main repeater (located about 50 miles inland at 5900') for coastal North/South freeway users.

Our original idea was to use a Ringo Ranger II or a Hustler G7, but since inland coverage is not necessary (and the oceans is to the west) we were wondering about two beams pointed South & North-West (the directions of the freeway from the new receiver site)

A 7-element end-mount beam provides approximately 11db gain while the omni's are 7-9db. The other factor is cost. The 7-element beam is $47.00 and the omni's are (depending on model) ~90-150. So, that leaves me with the following questions:

How would two antennas be connected?

Would they do any better than the single omni?

What would *you* do?

Thanks in advance. Direct replies as you feel appropriate. (that means e-mail OR post)

P.S. I'm sorry if this message, PURE in Ham-Radio content, offends any readers! :-)

Re: Mag Article Wanted - VHF COMM 3/82

Wanted:

I am looking for a copy of the magazine article listed below:

Extremely Long Yagi Antennas
by Gunter Hock DL6WU
in VHF Communications Magazine (German magazine) 3/82

******* Attention VHF/UHF Operators *******

Appreciate any help. I have seen this article referred to many times by VHF/UHF antenna design software programs. I'd like to verify some of these programs. Actually, I have two different programs for designing DL6WU yagi's and both programs give me slightly different results. So I'd like to go to the source to see which one I should trust.

Thanks es 73's.
Don N9OO

Hello!

I am building a power inverter (12v DC to 120v AC) that I hope to eventually transform into a UPS for a computer... The schematic was obtained from Motorola and uses 2 MTM60N06 power TFETs in the output stage. It uses a Xtal controlled frequency source and outputs a very nice high power 12v sine wave. The part I need help with is finding the transformer. I need a 120v to 12v 40amp center tapped transformer. I have had no luck whatsoever in finding one. If anyone could point me to a source of such a beast, (preferably surplus :)) I would appreciate the info. I dont even know how much the thing should cost.

Thanx.

P.S. These accts will only be mine until May 9.

```

I think that these costs would add up to far more than most toll
charges. The system would be somewhat less reliable, too.

Hey, wait a minute... Did I buy all that gear to talk to strangers?
Now who's smarter?

^^

I found out that one of my favorite "Fresh Aire" tunes has some
20 WPM CW embedded in it. The song "Tocatta" on the album "Fresh Aire 3"
sends II6IT. Pretty catchy rhythm, too.

Aloha de KJ9U/KH6

You would get very good coverage with a pair of beams, but your coverage
to the east would be very limited due to the directionality of the beams.
7 element beams would have a relatively tight pattern.

If I were in your shoes, I'd think about using stacked folded dipoles.
You can customize the directionality of the system by locating them in
various places around the mast. You could get a pretty nice north-south
pattern and yet still have decent coverage to the east if they are
properly set up.

If you decide to go with a true omni, I'd suggest the G7 over the Ringo Ranger
II. The Ringo is an OK antenna, but I've seen a number of tests that
depict the antenna as having a relatively high radiation angle. The G7
is quite a nice antenna for the money and is one of the few good 220
omnis that you will find. I think you can plan to spend a bit over
$100 for the G7. The folded dipoles mentioned above probably go for
a bit less than that. Makers of folded dipoles include Antenna Specialists,
Phelps Dodge, and a few other commercial makers, although I'm not too
sure how many of them carry 'em for 220.

--- Jeff

I would add that the Satellite Receiver is located in Sandy Eggo county and that the coverage area to be enhanced is the Interstate 5 freeway corridor from approximately 20 south of the receiver to 30+ miles north northwest of the receiver. Omni coverage is not needed and in fact would basicly duplicate existing coverage. This I5 corridor is riddled with low-lying coastal hills just west of the freeway and is a major shadow to the repeater site 30 miles east. Hence the desire to fill in the noisy I5 area....Mike

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number

69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]
69-69	Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

I have some old ROHN catalogs (back to 1975) and there is not a single crank-up tower. In fact, there is a flame about how unsafe crank-up towers are and why you should by ROHN instead. This leads me to wonder if your tower is a real ROHN. Does it say "ROHN"? Maybe you would have better luck contacting Hy-gain.

As a new ham (2.5 weeks!), I don't yet own the various callbooks and other necessities of DX life. Consequently, I was wondering if anyone out there in netland could help with a few addresses:

DF8WS
EL7X
HB9AQW
K1VV
KB8ANX

If anyone could look these up in a callbook for me, I'd be most appreciative. In fact, DF8WS was my first non-US QSO, so holds some special interest for me. Thanx in advance to anyone who can help out... 73s

In response to WB2UMF's comments on the ARRL file format for contest logs:

>   All of my logs are kept by computer using software that I have
> written. I have no problem formatting a floppy in the format that you
> request. My question is why should I bother? It might take me a day
> to write the code and I would have to copy the files off my UNIX
> system onto an IBM PC to write the floppy. All for zero gain. And I
> don't even get the floppy back. Why should I go to that bother
> instead of just printing a log on my laser printer?
>   To attempt to answer my own question, there are several things
> at would motivate me to send in an electronic log and even pay for
> the chance to do it. First, if it were required for stations with
> over say 500 QSOs. This might cut down the competition. A more
> positive reason would be getting an audited log back. I would be
> happy to pay $10 to $20 to get back a floppy with my cross checked
> QSOs. A simple flagging of unique QSOs would be of value.

Your raise some very valid points. We ruled out any requirement for submitting logs on diskette, simply because not everyone uses a computer or even has access to one, especially DX stations. However, we are considering various proposals for offering incentives to submit logs on diskette. I think yours is a good one - in fact the CQ Contest Committee will return anyone's submitted log on disk with a list of uniques and the average unique rate for that class of entry. They also reduce the penalty for busted calls and unmarked dupes if logs are submitted on disk.

> First, you say, "aligned by column", what does that mean? I assume
> that you mean in fixed width columns padded (on the right or left?)
> with ASCII blanks and with a single blank between columns. How about

> a comma between columns?

Yes, that's exactly what we meant. "Aligned by column" would allow the log checking staff to "screen" each log as at comes in and to assign columns to each piece of data, assuming that data item (and no other data item) is always located within the assigned field . The alternative would have been to read each line and look for a data delimiter, such as a space, tab or comma. The majority of log submissions are formatted in columns. The left or right justification doesn't matter, as long as the data is contained within the assigned columns. The reason for specifying 15 columns for the call is because that is the maximum envisioned length of a call (e.g., FG/KA1XYZ/FS/m). It would be desirable to have the total column width under 80 characters, though not absolutely necessary.

> The statement "Complete exchange sent" and "Complete exchange
> rcvd" is not very specific. What about contest like SS where there
> are long exchanges? Should there be blanks in this column making it,
> in effect, multiple columns or do you want something like
> 123BWB2UMF65EMA as one hunk?

Again, as long as each data item was "lined up" by column it would be OK. Maybe a better choice of words is needed instead of "aligned by column", which could be misinterpreted. Any suggestions from anyone?

> While there may be a few popular logging programs that many
> people will use, some of us will want to roll our own. You need to
> specify EXACTLY what the ARRL will and will not accept. I have been
> writing software for 30 years and the single largest cause of problems
> is lack of a clear statement of what is wanted. Do not assume that
> the world of amateur programmers out there will know what you mean.

Yes, we didn't want to discourage anyone from "rolling their own". Ironically, we started off proposing a very rigid ASCII format and subsequently decided to "loosen up" the format in order not to discourage anyone from submitting a log on disk. I agree that the specification needs to be reworded in order to make it "perfectly clear" what's required. The proposed policy on accepting other formats is that they will be accepted, but must be accompanied by a paper log. However, we hope that simplicity of the proposed format will encourage submissions in that format. Regarding non-MS DOS, there's a 24-hour BBS is available for use in submitting logs, and may be an attractive alternative for people like you who make less than several thousand contacts - hi! All you need to do then is send a signed paper summary sheet in the mail.

Any comments received will be passed along to the ARRL Contest Advisory Committee, all other contest-related comments are welcome... An SASE with 85 cents postage to my Callbook address will bring you copies of CAC correspondence related to the file formats, including the proposed format.

>that difficult-to-solder stuff used for cheap earphones Litz wire?

No, that frustrating stuff is called _tinsel_ wire. It's completely different from Litz, and is used in telephone cords because it is designed to not break with repeated flexing. It's usually used with crimped connectors. The only way I've been able to solder the stuff is to laboriously unwrap each little flat strand of copper (bronze?) from its fiber core, then twist them together and use solder flux.

>I recently went looking for a crystal earphone for a project which
>needed a high-efficiency, high-impedance audio output. Surprise!

>I guess that means kids won't be able to build simple crystal radios
>anymore :-(

High-impedance earphones went the way of vacuum tubes, but it should be possible to make excellent and sensitive earphones with the piezoelectric substances now available. I'm also looking for some nonmagnetic earphones to use with my 3.5kHz "cave radio" because feedback from phones to loop antenna is a problem.

This stuff is commonly called "tinsel wire". It is used where the cable will be subjected to lots of flexing, so you find it in guitar cords (the coiled kind) and in older telephone handset cords. It is not the same as Litz wire, since the individual conductors are not insulated (although it probably would work similarly, due to the insulating fiber filler and the tinsel-like shape of the conductors).

Most of time the connections are crimped, and I hope I never have to solder tinsel wire again.

I found myself trying to make a similar decision about a year ago. I was replacing a previous station which had been robbed and I wanted a multimode transceiver to drive my transverter array; I have a 50 MHz through 10 GHz phase locked "transverter stack" (Feb/Jun/Oct 1988 HR Magazine) and wanted something to drive it with. Since I'm getting old and don't learn new interfaces as easily I wanted to buy two of the same radios. That way I could operate two vhf-microwave bands simultaneously, or liaison for a vhf-microwave schedule on HF without getting confused about which button to push.

I ended up getting two IC735s. The 725 was available as was the TS440 but I wanted passband tuning which the 735 doesn't have and Kenwood seems to have forgotten about transverter support on their newer radios (:>[
By cutting two diodes I get general coverage transceive out the transverter output.

The performance of the 735s seems to be a good deal better than any tube type transceivers I've ever owned including two Drake Lines and an R4(solid state). Third order intercept, dynamic range and spurious performance seems very competetive and phase noise is also acceptable. The 735 is specified better than the newer DDS Icom radios too.

They aren't perfect radios but I've had one of them running full time for over a year driving a 2M transverter (on packet) with no failure.

Hope this helps.

This weekend on the College and University Net, we are going to try to have a special event station set up in San Diego at the Crew Classic to attempt to pass traffic and messages for the various colleges and universities that are participating. I will try to be on the air at 1800Z on 28.425.   Hopefully the conditions (weather and RF) will be satisfactory for the event. If you want to be involved in this, please tune in this Saturday. Please note, we are trying to get this setup in a hurry, so if things dont work out, please continue on with the net as normal. I will try to call with my callsign (N6WUY).   This is also not sanctioned by anyone, so we are just going to wing it. If you have any questions please REPLY by email not the net.
I will check my e-mail regularly. You can mail to any of the addresses below.

Talk to you this weekend (hopefully). 73 de Mike

I own an old Bearcat 210xl scanner which I bought back in 1985. With all the discussion of extended receive modifications available for various scanners, I began to wonder if anyone has ever modified their 210xl, especially since it has rather limited scanning ranges.

There are no mods posted to any MODS databases that I am aware of. Post or email replies. Thanks.

Can someone post the microwave bands other countries are authorized to use?

(not just the ones on other regions, but rather exactly what the PTT in those countries have authorized to hams)

Enquiring minds want to know.

I am fairly new to amateur radio (licensed last november), and am interested in building some simple "rigs". My main purpose is to gain some practical experience in working with transistors, analog circuits, and radio circuits in particular.

I would like to hear from any of you that have similar interests, (especially you elmers out there :-).

I would also like to hear recommendations about books, magazines, etc. Also recommendations on mail-order part supply houses, as I am not close to any large metro areas. For example, a couple of the projects call for an audio transformer (10k to 2k), and I haven't had any luck finding it locally.

I have access to the following books:
Solid State Basics for the Radio Amateur - ARRL (this is is just about right for me, albeit a little old, eg no WARC bands)
Solid State Design for the Radio Amateur - ARRL (probably great, but over my head right now)

Understanding Amateur Radio - ARRL (good, but tries to cover a lot of material in one book)
QRP Notebook - ARRL (looks really neat, but it assumes the reader is already pretty comfortable transistors, etc)

Note: The fact that some of the above books are over my head doesn't mean that the books aren't good-- they just aren't aimed at beginners.

So, I would sure like to hear from you folks out there. By email, or on the air sometime. I'd love to tune in to a nice discussion on building QRP rigs, etc. I operate on 80, 40, 20, 15, and 10M.

Thanks in advance! de kc4mxj   bill welch uunet!ingr!bill

I have spent a lot of time trying to increase my speed, and am not too pleased with the results. I would sure like to hear from some of you out there who have already passed the 20wpm mark. What method did you use? Computer programs? Tapes? What speeds? What type of text did you practice with?

I used the computer for my initial training and Novice test, then switched to cassette tapes-- recordings (from the computer) of simulated QSOs, the 30 most frequently used English words, etc.

Thanks in advance! de kc4mxj bill welch uunet!ingr!bill

p.s. if you want to discuss code vs no-code, please post your own article, and change the subject line! :-)

Brian-
I hope this helps. The QST article which describes how to determine
in which Grid Square you reside, was titled "VHF/UHF Century Club
Awards" by John Lindholm, W1XX and was published in the January, 1983
issue on pages 49-51.

By the way, you're either in EN60ke (40 deg, 11.5' N by 87 deg, 7' W) or
                             EN65ke (45 deg, 11.3' N by 87 deg, 7.3' W).

I suspect the latter, because my geography is relly screwed up, I don't
see how any part of Wisconsin could be much
further South than azimuth 270 deg from my QTH here in Rochester (FN13fb,
lat. 43.07 N by long. 77.54 W).

By the way, there may be others interested in determining their grid
locator, and I had to spend a fair amount of time looking through QST
indices to find the article, so I thought I'd post this to help their
search, as well.

On April 7, 1990, at Worcester Polytechnic Institute in Worcester, Massachusetts, the WPI Wireless Association will be holding The Second Annual Open House in its Ham Shack. It will run from 10:00 AM to 4:00 PM (EST). We will be working on many bands (160m - 10m, 2m, 440MHz, as propagation permits), and in many modes. The Club Station, W1YK, is excellently situated on the roof of Salisbury Laboratories, which is one of the buildings on the top of a large hill where WPI is located.

Come and help us celebrate our 81st Anniversary!

New Information

In addition, W1YK will be trying to WAS on as many bands as possible, so if you can't be there, listen for us! Talk-In Frequency of 146.925 (-). It is supposed to snow a bit, BUT THAT WON'T STOP US! And we hope it won't stop you!!!!!

Humerous Section

BRING WOMEN!! The Male/Female Ratio at WPI is 7/1, and there are NO female members at the Radio Club!! We've got SATELLITE capability! Come and get spaced-out!! Come anyway!! PLEASE!! Packet Too!!!

Once again, feel free to call us or whatever for more information. The phone in the shack is (508)831-5446, and we listen to the Worcester Repeater at 146.925 (-). Or send email to me:

>It seems to me that amateur international communication could be served
>by the availability of a public-domain translation system for use with
>PC-based communication systems.

This is out of my area, but my understanding is that these systems are either very limited in what they can do or are quite big and expensive, or both.

But this *is* a most interesting topic. The development of packet radio has, for the first time, made it possible for amateurs to send and receive error-free text with a bandwidth almost large enough to do some real human-to-human communicating. (Unlike CW, which I suspect is called the "ham's universal language" because it's so slow and unreliable that you spend all your time in standardized QSO overhead -- you never get far enough to hit a language barrier! :-))

Ahem. Seriously, I think many more people might be more willing to practice a foreign language by packet than by voice, especially when their knowledge of the language is very weak. The main thing is that as long as the other guy is patient, you can take plenty of time and use your dictionary if necessary. Pronunciation and spelling ambiguities are avoided. Obviously this doesn't help you learn the spoken form of the language, but it might be a good way to get exposed to something you might not otherwise try at all.

With all the talk about the Belize ham, V31BB, not responding to QSL requests which include IRCs or money for postage, I looked at my log since the call was familar.

I too had worked him (in fact he was one of my first contacts when I received my ham license and I was thrilled!). I had made a note in my log (last fall) that he was visiting and taking care of a friend's house right on the beach. He went on about how he would love to stay on a while if he could find a way to support himself.

Looks like he found a way.

R. L. DRAKE is still alive and well and living in Miamisberg Ohio.

The address is: R.L. DRAKE
540 Richard St.
Miamisberg, Ohio 45342

Phone 513-866-2421

They still repair/refurbrish Drake Amateur gear but they are not currently involved in the manufacture of ham gear. I say currently because there is always that rumor around that says that they are planning to return to the ham market first with an HF amp and then with a tranceiver. The latest one (rumor

that is) has them paired up with Sony to produce an HF tranceiver called
The Sake. :-) Where do they come from !

Throw out the code tapes, the computer programs, the computer (just kidding). To increase your code speed:

GET ON THE AIR AND HAVE REAL QSO's WITH REAL PEOPLE.

It's just that simple. You'll find that the fastest people are in the novice band. The next fastest are in the general class portion, just above the extra class portion. Work the people who are going just a little bit faster than what you can comfortably copy.

In Message-ID <1990Apr4.053057.7176@tandem.com>, Stuart Phillips writes:

<Folks, I need some advice.

<Since 12/88 I've been working a TVI/RFI problem with my neighbor. Initial
<problems such as 10 m interference with TV channel 2 were soon fixed (at
<my *small* expense) but his stereo system proved to be a first class
<receiver of 40 m and 20 m RF. As little as 5 watts on 40 m at some 80
<feet horizontal and 30 feet vertical separation causes severe hum on
<his ONKYO stero tuner/amp.
<....................

I don't know if this is the latest edition, but I have a copy of a 31 page pamphlet titled "How to Identify & Resolve Radio-TV Interference Problems". It was published by the FCC and is labelled "second edition, September 1982". On page 11, titled "Audio Inteference and Remedies":

INTERFERENCE TO AUDIO DEVICES (TELEPHONE, STEREOS, AM/FM RADIOS)

"Telephones, electronic organs, stereo/hi-fi equipment, or AM/FM radios can be susceptible to interference. The source of interference will determine the affect on your audio device. For instance, if the equipment is picking up a nearby radio transmitter, you may hear the voice of the operator. When electrical interference is present, you may hear a sizzling or popping sound.

If you are receiving interference from a nearby radio transmitter, you should contact the operator and provide the Radio Operator Guidelines section of this handbook.

1. Generally, internal modification of your equipment must be made to eliminate the interference.
2. For safety reasons, it is recommended that any modification be made by a qualified service representative. The service representative should make the modification in the home while the interference is occurring, in order to locate the point at which the interfering signal is entering the equipment."

Further on the same page titled "OTHER AUDIO DEVICES"

"For other audio devices, such as stereo or hi-fi systems, the following steps may be taken before calling your service representative:

1. Replace unshielded wire between the amplifier and speakers with shielded wire.
2. Ground the affected equipment to a metallic cold water pipe or ground rod with a piece of 'bell wire,' which can be obtained at most electronic, hardware, or variety stores. Do not ground 'AC-DC' type devices. Normally, devices which may safely be grounded will provide a grounding terminal. If no terminal is provided, then you should consult a qualified service representative for advice."

Page 12, "RADIO TRANSMITTER OPERATOR INFORMATION"

RADIO TRANSMITTER OPERATOR GUIDELINES

"Some interference problems can be traced to radio transmitters. When you receive an interference complaint from your neighbors, the following steps will help resolve the problem.

We encourage you to cooperate with your neighbor(s) and assist them in resolving the problem. When a positive dialogue between you and your neighbors exist, the problem will be more easily resolved.

It will also be most helpful to the commission and the general public if you would encourage a cooperative attitude among other radio operators.

Voluntary implementation of the steps outlined below, may prevent you from being directed by the Commission to implement these measures. The Commission does not, however, require that you service or modify your neighbor's TV set or audio device."

Sections on CB and Linears omitted.....

RESOLVING AUDIO INTERFERENCE

"Although audio inteference (often called audio rectification) is usually resolved by modification of the affected device, you as a radio operator can take certain steps to reduce the probability of audio rectification by eliminating circulating radio frequency (RF) currents in grounds and metal objects in the area.

1. Your radio transmitting equipment should be effectively grounded to a metallic cold water pipe or a ground rod driven into the ground at least 8 feet. The ground lead should be at least #10 wire or copper ribbon. The greater the surface area of the ground lead, the more effective it will be. Also, the ground lead should be as short as possible.
2. You are reminded that CBers are limited to 5 watts input power. Operating with excessive power is likely to cause audio interference problems.

If you need assistance in performing the above modifications to your equipment, you can contact the dealer or manufacturer's representative. An FCC-licensed service representative may also be able to assist you. A licensed representative normally will be available at your local CB repair or Service Center.

RESOLUTION OF INTERFERENCE FOR AMATEUR TRANSMITTER OPERATORS

1. If you have a linear amplifier on your amateur transmitting equipment, use two lowpass filters. One filter should be installed between the actual transmitter (exciter) and the input to the linear amplifier. (This prevents harmonics generated in the exciter from reaching the linear amplifier.) The second filter should be installed at the output of the linear amplifier to reduce harmonic and spurious content.

2. One unique interference problem to TV Channel 2 is from an amateur transmitter operating on the 6 meter band. This is due to the close proximity of the frequencies involved. You may wish to follow the procedures outlined in the Technical Information for Service Representatives section, page 23, to eliminate this type interference. You are not, however, required to service or add filtering to the complainant's television, and should not take any such action without the full cooperation of your neighbor.

3. You are reminded that amateurs are licensed to use only the amount of power necessary to carry out communications.

4. Local Television Interference (TVI) Committees are available to assist you in resolving interference problems. Contact the nearest FCC district office (See addresses beginning on page 21), or the American Radio Relay League, Newington, Connecticut, for assistance in locating a TVI committee in your area."

Don't know what position the FCC takes today but this is what they said eight years ago. GOOD LUCK!

73, Norman

The Bro! sez...

One day last year "me 'n' the boys" (the other guys in the Texas A&M Amateur Radio Club - W5AC) watched Die Hard on video and could not keep ourselves from laughing at this.

In answer to your question about his knowing the police frequencies, he didn't have to. Quite insultingly, the Kenwood radios used were supposedly (ACK!) CBs!!! Early in the show, he gets on the roof of the building and says "Channel 9" something or other... don't ask me why we are supposed to swallow the idea that the police use CB radios, but I guess it works for the uninformed public. Hey, they used them on the Dukes of Hazzard!

The thing we couldn't get over was their blatant abuse of radio operation procedure. For instance, the ability to interrupt someone while he is talking on another radio. Full-duplex HTs??? Right.

This was most dramatically demonstrated when the hero was patching up his well-cut and bloody feet in a restroom. He somehow locked the HT on transmit and was able to carry on a conversation with the cop down on the street. What a laugh.

As I said before, though, I'm sure for all Americans that have never touched
or used a radio it works. We just have to laugh and enjoy the inside
joke ourselves.

I remember watching ALF one evening and briefly saw a nameplate with a call sign on it WA6--- I think. Has anyone seen this? If so who does it belong to (given the call sign, we could look it up in the call sign server).

I hate to watch such a dumb show just to get the call sign....

No, this is not litz wire. The stuff in earphone wire that's
impossible to solder is just that--tiny metal wires or films wrapped
around a fiber core.

Litz wire is a bunch of strands of conductive wire that are
electrically isolated from one another except at the two ends.

>%   2) On 3 different radios(transmitters) I see the following:
>%   a) RF Input- 5 Watts; RF Output 4 Watts
>Somebody is lying. Possibly in the marketing department.

Actually not, it is real easy to get 4 or more watts out of a CB with only 5 watts DC input (quiescent). (Maybe even 10 watts out for only 5 in... it's not magic, its bending the rules just a bit).

>%   b) RF Input- 5 Watts; RF Output 3.5 Watts
>This I find hard to believe also, but it might be possible for a "plate"
>modulated class C final, for AM only.

Actually this may be quite accurate, CB final outputs are "PLATE" or as we in the biz say "collector" modulated class C amplifiers. I'd expect to see a realistic 3.5 watts out under normal conditions.

>%   c) RF Input- 5 Watts; RF Output 2.5 Watts
>This is easy to believe.

If this is true, then the transmitter isn't working efficeintly.

OK JOHN, HOW DO YOU GET ALMOST 5 WATTS OUT FOR ONLY 5 IN WITH AN AMPLIFIER THAT ISN'T RUNNING ALMOST 100% EFFICIENT?

I'm glad you asked. Its easy, just bend the rules a bit. How?

Look at the diagram of any of the modern CB rigs. You may notice a diode and a capacitor in the audio circutry feeding the collectors of the driver and final RF amps. Simply put, the non modulated DC input to the final is in fact ~5 watts. If one were to whistle into the microphone and produce a nice sine wave, a portion of the audio amp power output is converted into a little extra DC power that "kicks the power up to the final amp" during periods of modulation. This nonlinear pumping of the final power will not cause enough distortion to cause any noticeable degredation of the signal quality. (HAHAHAHAHAHAHAHAHA) And it may be close enough to legal that the FCC lets it slide. Thus, one will note that the appearent power output, when measured with a BIRD watt meter, will actually go UP if you make sounds in the microphone. This shouldn't happen on a real collector modulated RF transmitter, but it does on CB's.

Love it when those marketing folks figure out a way to adjust reality!

I plan on taking the 20wmp test next week. For me, getting my speed up hasn't been too painful. (FLAME PROTECTION ON) I've learned to copy code using computer programs only. (FLAME PROTECTION OFF). I generally practice 30-45 minutes a night, and have been doing so for the last 2 weeks.

The program I have allows the send speed and the character speed to be adjusted separately. By setting the character speed at 20wpm and the send speed at 8-13 wmp, I had sufficient time between characters to recognize and record (using pencil and paper) the character being sent. Whenever I reached a point at which I could copy random character groups with 50% accuracy, I would bump the send speed up another 2-3 wpm. Occasionaly I would try and copy at 23wmp. Even though I could only get about 20% of the characters at that speed, it seemed to improve my ability to copy at 20wmp. I spend most of my time copying random character groups (letters, numbers, and puctuation). Usually, before I shut the computer off, I spend a few minutes copying regular text at 20wmp. I sometimes get in trouble with text because I try and second guess the word being sent. When that starts to happen, I have to try and ignore the message content and pretend that I'm back copying crypt groups. It works for me.

Good luck on your upgrade.

You also described the Drake TR-7 with remote VFO and cooling fan. It
doesn't have FM as is, but it's no big big trick to modify for that. I used
one for years and loved it. Wish economic concerns hadn't forced me to sell
it. In the U.S. a good condition used '7 brings about $650.

The requirement to send hasn't been enforced for some time, as far as I know.
I had to send when I took my last exam in about 1976, but I think it was
shortly thereafter removed as a test requirement.

They started in the 30's marketing an airplane kit. No, not a model
airplane kit. An honest to God get in it and ride it airplane kit. Then
they had a boat kit and (I think) furniture. They returned to civilian
pursuits immediately after World War 2 with a 5" oscilloscope kit based on
military surplus CRT's and took off from there to where they are now -

just another dealer for other people's products.

The April 1990 issue of _Sport Aviation_ (monthly magazine of the Experimental Aircraft Association) has an article on page 31 entitled "National Airspace System Plan Forum Hosted by EAA." In this forum, Federal Aviation Administration representatives were asked pointed questions about new requirements for very expensive avionics, including 720-channel aircraft radios with 25kHz spacing.

The article quotes Gerald Markey, manager of the FAA's Spectrum Engineering Division, as saying:

> "The FCC has about 2200 employees, 1100 of which are lawyers.
> Most of their decisions are legal rather than technical."

I am looking for information on building / buying a low power
VLF transmitter for LW beacon application. I understand there
is a frequency range somewhere around 150 Khz where experimental
beacons are A-OK. Does anyone have any information on this
subject?

And, be fully prepared to pay MORE for a service which costs the telco LESS to
supply than it does for them to supply voice lines for the modems. Just like
when they charge you more for DTMF dialing than for rotary dialing.... They
save money, and you pay more for it.   (It takes fewer DTMF receivers and dial

registers to accept DTMF tones, partly because you spend a lot less time dialing
with DTMF (on average) than with rotary.)

Oh, well... (and no smiley this time!)

I asked a similar question a while ago of the ARRL VE coordinator.
Everyone must take and pass the test, period. However, if I recall,
they can use someone to help copy (I believe the sample was
someone they could talk to who would copy for them). Believe it
or not, the best source of an answer would be for YOU to call the ARRL
and ask them. I might have misremembered, so post the correct answer
later.
tnx
Glenn

I am interested in locating any computer code (preferably "C", but I'll take ANYTHING) that *adaptively* converts dits and dahs (actually, the individual bit lengths) into their equivalent characters. This is the type of thing that some multi-mode controllers (like the PK-232) do.

It should be able to automatically determine the sending speed and track it (if it varies) and adapt to the particular "fist" of the sender, compensating for different ratios in the dit/dah/space lengths.

It would be nice if it had some AI-like features that tried to correct errors (either in the sending, or due to static). For example, if the character is not a valid letter, it may be two letters run together, or a dah broken into two dits by static, etc. It could pick the most likely candidate based on rules involving timing, context, etc.

Pointers to any articles written on the subject of automatic reception of CW signals using adaptive techniques would be appreciated.

> necessary.

Mygawd, Phil--I hope you aren't suggesting that people do this during real-time keyboard-to-keyboard contacts. My experience is that most hams type so slowly anyway that it seems like eternity waiting for a response. I dread the thought of the additional delay that would be introduced if they're constantly consulting a dictionary and typing in unfamiliar words!

I don't think "patient" would describe a ham who'd be willing to sit through that. "Masochistic", perhaps. :-)

Patty

p.s. Yes, I know that people can begin typing their responses while the other person is sending, and buffer their text until it's done. But a fast typist can still catch a slow typist unprepared. Or maybe folks just aren't pre-buffering their responses.

>do people with questions call on a seperate line ?.

My understanding is that the connections will be one-way. Callers may leave questions on an answering machine which will be periodically "dumped" during the conference and read on the air in non-real time. The reason for this is to eliminate the air time that would otherwise be spent on overhead like bad connections, callers that hang up, requests to turn down radios to avoid feedback, etc.

The U.S. has an unofficial "ham" band at 160-190 kHz (1750 meters). Part 15 of FCC Rules and Regulations permit license-free operation in that band with the limitations of one watt transmitter power and 50 feet maximum antenna length.

Most 1750m operation is beacons; there are few two-way QSOs. 1750m operation is a challenge: A 50-foot antenna at that freq. must be super efficient-- It must have a very high-Q loading coil and a super ground system. Receiving requires sophisticated antenna preamps and converters, and selective audio filters. Atmospheric noise makes the band fairly useless in summer. The DX record on 1750m is over 1000 miles. The current hot topic among 1750m enthusiasts (called "Lowfers") is BPSK (binary phase-shift keying) at very low baud rates, using WWV-locked frequency control.

1750m transmitters are very easy to build. The newsletters listed below have published numerous plans.

Well, I *did* qualify my statement by using the word "patient". But the fact that so many hams are willing to tolerate 1200 baud or even 300 baud packet in real time across NET/ROM networks or HF paths says that there must be a lot more patience out there than you or I would give them credit for.

Seriously, non-real-time email would probably be a lot more practical.

Subject: TAPR TNC High Speed Serial Port Upgrade for 19.2 K baud
Message-ID: <5629.261d18c5@uwovax.uwo.ca>
Date: 7 Apr 90 02:31:32 GMT
Lines: 31
Posted: Sat Apr 7 03:31:32 1990

This is a relatively easy modification that can be performed to most TAPR TNC-2 boxes to allow 19.2K aynchronous communications between the TNC and your computer.

FIRST *** Replay U3 (LM324) with a TL084CN or TL094 FET op-amp. The LM324 craps out at 9600 baud and is dead at 19.2K.

Cut the PC trace that goes to PIN 2 of U1 (divider) about 1/8 " from the I.C. itself. Solder a jumper from pin 10 of U1 to the trace that you just isolated. Solder to the side of the trace that goes to pin 1 and pin 6 of SW2 baud rate selector switch.

This supplies a 307.2 Khz clock (19.2K/16) to pin 1 which is now 19.2 K baud on the serial port instead of 300 baud as well as pin 6 which is now 19.2 K to the modem instead of 300 baud. Turning on SW1 and SW7 will allow 19.2 K baud on the serial port and 1200 baud on the radio port.

**** NOTE ****

The 19.2 K baud rate is UNRELIABLE with the PMS code. We are using the TAPR 1.1.6 code (or lower) without PMS and are having excellent results on the serial port. The radio port is currently running at 9.6 K and is connected to a G3RUH modem and a Kantronics DVR 2-2. Plans for next week include increasing the G3RUH speed up to 19.2 K baud.

Some japanese companies have marketed calculator sized translating devices
do a word for word translation. At the Japanese-English Machine Translation
Conference in December I saw a calculator size device with a tiny scanner that
could scan english or japanese text and output the equivalent word on its
LCD screen. Students and tourists are finding these useful and perhaps
some japanese hams who see unfamiliar words on their screens while copying
a packet or RTTY signal. More ambitious work is done in the European
Community and Japan. Xerox has been successful with machine translation
by getting its tech writers to use a special limited vocabulary and simple
gramattical structures in the manual so as not to confuse the machine.
Sometimes big systems do a good job with over 90% reliability, but the
worry is what horrors lurk in the remaining 10% -- the poison cookie in the
cookie jar problem. At the translation conference it appeared that that
many good papers in linguistics bearing on the problem are being produced
while several japanese companies have translation systems up and running --
several running on a PC, generally an NEC PC-9801 series PC -- and
moving forward by making incremental improvements in hardware and software.
The difference in US and Japanese approaches to this problem seem familiar...

Yes indeed. A japanese   ham told me on RTTY once he wouldn't dare
speak english. In many countries like Japan, people read English much
better than they speak it. An if we work 'em on packet perhaps their
written English will come along too!

I have just purchased a Kenwood TM-621-A 144/220 MHz Dual-Bander and
have found the extended VHF transmit will not go above 151.995 MHz.
Other owners have found the same result. Is there any way to get the
radio above that frequency without major modification? If anyone
has this information, it would be much appreciated.

you can send any info to: C. Crosby

Reading a foreign language you don't yet know is a lot easier than listening to one because you at least get to see where the words end and begin.

MONDAY APRIL 9, 1990

SpaceNews is published and distributed weekly around the world on USENET and Amateur Packet Radio. It is available for unlimited distribution.

* COMET AUSTIN *

The April issue of Astronomy Magazine has an article on observing Comet Austin, packed with info, charts, event predictions, etc.

The following table was given in the article. It gives, for each week during the best period, the estimated magnitude, best time to look, altitude (in degrees) from the horizon and direction at twilight, and some comments. I have added more comments gleaned from the text. All are oriented to viewing from the northern hemisphere, specifically from the US.

Week of	Mag.	Phase	Time	Alt.	Dir.	Notes
Mar 25	3	New	Evening	7	W	Twilight interferes
Apr 1	2	First	Evening	6	WNW	5 deg above Mercury 4/1
Apr 8	1	Full	Evening	4	NW	Brightest, but near sun 13 deg to right of Mercury 4/8
Apr 15	1	Last	Morning	11	NE	Improves rapidly 1.5 deg SW of Beta Andr 4/19
Apr 22	2	New	Morning	19	NE	Excellent south of M31 5 deg 4/25 tail might cross M31 4/19-4/22 rises 3am 4/25, tail rises 2:30
Apr 29	3	First	Morning	28	ENE	Good early in week
May 6	3	Full	Morning	38	ENE	Moon hurts visibility
May 13	3	Last	Morning	51	E	Better late in week
May 20	3	New	Morning	56	SSE	Excellent
May 27	4	First	Early Morn.	38	S	Good after midnight Crosses M17 morning of 5/31
Jun 3	5	Full	Midnight	24	S	Moon overwhelms comet
Jun 10	6	Last	Late eve.	19	S	Better late in week 5 deg S of Antares 6/11-12

* STS-31 NEWS *

Liftoff of the tenth flight of Discovery is scheduled for 9:21 AM EDT (1321 Z) on April 12 from Kennedy Space Center, Fla., launch pad 39-B, into a 330 by 310 nautical mile, 28.5 degree orbit. Nominal mission duration is expected to be 5 days 1 hour 15 minutes. Deorbit is planned on orbit 75, with landing scheduled for 10:36 AM EDT (1436 Z) on April 17 at Edwards Air Force Base, California.

Launch Site: Kennedy Space Center, Fla.
Launch Complex: 39B

Orbiter: Discovery (OV-103)
Altitude: 330 nm circular
Inclination: 28.45
Duration: 5 days, 1 hour, 15 minutes

Landing Date/Time: April 17, 1990, 10:36 a.m. EDT

Primary Landing Site: Edwards Air Force Base, Calif.

Abort Landing Sites: Return to Launch Site -- KSC

Abort Once Around - Edwards AFB, Calif.

Crew:
Loren J. Shriver - Commander
Charles F. Bolden Jr - Pilot
Steven A. Hawley - MS-2
Bruce McCandless II - MS-1 and EV1
Kathryn D. Sullivan - MS-3 and EV2

Cargo Bay Payloads:
Hubble Space Telescope
IMAX Cargo Bay Camera

Middeck Payloads:
Ascent Particle Monitor (APM)
Investigations into Polymer Membrane Processing (IPMP)
Ion Arc (Student Experiment)
Protein Crystal Growth (PCG-III)

As quoted from <40990@iuvax.cs.indiana.edu> by commgrp@silver.ucs.indiana.edu
(BACS Data Communications Group):
+---------------
| >VLF transmitter for LW beacon application. I understand there
| >is a frequency range somewhere around 150 Khz where experimental
| >beacons are A-OK. Does anyone have any information on this
|
| The U.S. has an unofficial "ham" band at 160-190 kHz (1750 meters).
| Part 15 of FCC Rules and Regulations permit license-free operation in
| that band with the limitations of one watt transmitter power and 50
| feet maximum antenna length.
+---------------

Interesting. "Few QSOs" there may be, but I've heard at least one of them. I thought either I'd overheard pirates or the radio was acting up: I was about a mile from a set of TV transmitters, and within 8 miles of many other TV and AM/FM broadcast band transmitters; the radio was getting overloaded and doing *weird* things. But I could identify the "overloads" quite easily by their characteristics; the QSO I picked up didn't act like an overload.

Come now, the ARRL is right in the thick of really important breakthroughs
in computerizing logs for the next DX contest on the Antique Wireless
Museum bands (HF).

**** UoSAT-OSCAR-11 BULLETIN 212 07 April 1990

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT-OSCAR-14 ** (de G3YJO)

Preliminary tests have been carried out by G0/K8KA & G3RUH using the PACSAT Communications Experiment as a 9.6kbps digipeater, and early data has been received from the Cosmic Particle Experiment.

** UoSAT-OSCAR-15 **

The team at Stanford have succeeded in detecting local oscillator (LO) leakage from the UO-15 command receiver whilst the spacecraft was in eclipse - indicating that the on-board NiCd battery is indeed functioning. Tests to check the command system now follow.

** DOVE-OSCAR-17 ** (ASR)

AMSAT Command Station N4HY is using Mode S to upload software, however, due to a low index of modulation and high Doppler shift on the DOVE S-Band transmitter, DSP techniques are being used to copy the packets transmitted on 2401.220 MHz.

** RUDAK-2 ** (DB2OS & DJ0HC/KE6MN)

RUDAK-2 has now been integrated into a Soviet Geological research satellite, GEOS, scheduled to fly in July. RUDAK-2 will not only carry a Mode B linear transponder but also a variety of packet radio experiments with data rates from 400-9600 bps using various modulation schemes. It will be compatible with AX.25 protocols and those amateurs equipped for FO-20, PACSAT, LUSAT, AO-13 PSK telemetry, and UO-14.

Linear Transponder Uplink: 435.030 - 435.120 MHz (90 KHz)
Linear Transponder Downlink: 145.880 - 145.970 MHz (inverted)
O/P Power: 12 watts max.
Beacon : 145.880 MHz, CW telemetry.

Gain of satellite RX/TX antennas: 2.3 dBi each (dipoles)
Input sensitivity: -125 dBm (435 MHz) for a C/No of 45 dB/Hz

SAT-RX-1: 435.016 MHz +-10 KHz 1200 bps, FSK, NRZIC/Biphase-M (JAS, PACSAT)
SAT-RX-2: 435.155 MHz +-10 KHz (AFC) 2400 bps, BPSK, Biphase-S
SAT-RX-3a: 435.193 MHz +-10 KHz (AFC) 4800 bps, RSM, NRZIC/Biphase-M
SAT-RX-3b: 435.193 MHz +-10 KHz (AFC) 9600 bps, RSM, NRZI (NRZ-S) +Scrambler
SAT-RX-4: 435.041 MHz +-10 KHz (digital AFC) RX for RTX-DSP experiments

The downlink can be switched to the following operating modes:
Transmit frequency: 145.983 MHz

Mode 1: 1200 bps, BPSK, NRZI (NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (AMSAT mode for OSCAR-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S (planned for OSCAR-13)
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) + Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)
Mode 7: FSK (F1 or F2B), e.g. RTTY, SSTV, FAX, etc. (only for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (e.g. speech)

RUDAK-2 is a joint project of AMSAT-U-ORBITA, the Adventure Clubs in Moscow and the AMSAT-DL/RUDAK Group in Marburg, Munich and Hannover.

To all you future extra classers out there:

For almost 30 years I was content with a general class license. I listened to ARRL code practice now and then, just to see if I could still copy 13wpm. And I worked mostly CW, because with limited power, and using only indoor antennas, I wanted to get out as far as possible.

Then someone kindly pestered me to try the ARRL CW contest. I got hooked on contests. Then they pestered me some more to upgrade to Advanced and Extra.

Two weeks ago I got a hamfest flyer that said a VE test session would be held. So I dug in to the Advanced study guide, about an hour a night after work. That wasn't too bad, so I got the Extra study guide too, thinking, what the heck, get the written tests out of the way and then really go for the code. I finished the extra stuff, and with two days to go until the hamfest, I started in on the computer tutor :-). I concentrated on QSOs sent at 25, spaced for 22wpm. The day of the hamfest, I could copy about a half page without missing too much - I couldn't do random words or code groups very well at all.

I got to the VE session, and the 20wpm test was first on the agenda. They played a tape in a boom box at the front of a big empty room. The test started, and I could hardly write. The QSO was a lot wordier than the simulated QSOs I'd practiced on, but guess what.. they sounded a lot like what I'd copied on the air for so many years. The code sounded fast, but a LOT slower than the code I had copied during CW contests.

The test finally ended, and they handed me the question sheet. I had missed most of the word "carpenter" but I guessed. I had missed the state "maine", but I had "m.in". I got those two guesses right, and choked on the transmitting station's call (I put down the called station's call!!). SO I PASSED WITH ONE WRONG!

Then two more miracles happened when I passed the Advanced and Extra written tests.

The moral is: You can do it too!! Real QSO's (static, fading, poor fists, unpredictable info), CW contest or two, and computer tutors all seem to help. Also, stay tuned in during the test as if you're copying your first rare DX or something. Get every character you can - guesses count these days. GO FOR IT!

Since I am better acquainted with this 'posting' of news, I would like to ask for advice on the same referenced subject. However, I would like to know if anyone out there knows an attorney I may consult on the ref. subject. Also, does anyone imagine what grounds there is for a lwsuit against me--that my rig causes very anoying RFI even when the stereeo is not on? (Realize I understand the reasons for this RFI but that the neighbor is not cooperating). I've already contacted the FCC field office here in Arizona (Douglas) and forwarded a full report, including a history on this case as well as details of what I've done to my gear. I have no interference problems in my household--I dare not (the XYL..know what I mean?).

So......wat say de WA6PBJ

Why is it that the ability to copy Morse Code onto paper is the desired goal? Are there any cases of need to copy voice onto paper?

Well, of course one would copy radiograms onto paper, whether sent by voice or sent by Morse Code. And there is a provision on the code test whereby a minute of solid copy passes the test.

I just don't see why I need to be burdoned with the concept of actually copying code to paper. What is wrong with copying code in your head just like you do voice?

Nothing happens unless the police decide to pull up your VIN number, act like it is reported stolen, and proceed to track your location and movement.

> Does the ARRL insurance cover mobile rigs if they are thieved while
> in someone else's car? Quoting from the info pamphlet "Your
> equipment & accessories are covered in your car as well as your home."

Apparently not. Don't loan equipment or even borrow equipment as it is not covered under these circumstances by this policy. Some homeowners or renters policies will cover things under some circumstances that the ARRL policy will not. You need to shop for your insurance both on the basis of rates AS WELL AS ON THE BASIS OF TERMS. You need to see the actual policy wording. Insurance salemen don't like to get this information to you until you are sold, though, so you will need to push them for it.

> Can I schedule general purpose test gear like scope's, dmms?

I doubt it. The plan does cover computer hardware associated with your amateur station, and up to $1000 worth of software (provided of course you list the items and pay the appropriate premium).

> Whenever I try to phone the administraters of the plan,
> A.H. Wohlers & Co, to ask them directly, I always get a busy signal.

Which number are you calling? Of course I bet they are real busy these days.

SB RTTYDX @ RTTYDX $RTDX1304
RTTY DX Notes, 1of3, 4/13/90

RTTY DX Notes for Weekending 13th April 1990.
Part 1 of 3.
BID: $RTDX1304

I would like to repeat some comments that I have made before. It concerns the removal of the Bulletin Identification Number (BID number) of these notes. It has been reported that in some instances the BID number has been removed and replaced with a local BID number. This has caused confusion, and some bbs suffer the multiple delivery of the DX notes with different BID numbers. Please only pass on the received BID number. If you cannot do this, then allow someone else who can pass on the correct BID to do so. Then of course we have the stations who remove the opening stanza and the credits as well as the signoff, and pass the notes along as (my) DX notes for the week. Chaps, if you think that you can do a better job, please let me know and I will let you do the whole thing. A happy Easter to you all.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1ACB, JA1BLV, OD5NG, TG9VT, VK2EG, W1DA, W2JGR, W0LHS and the Tri-State DX Association VHF packet cluster. Thank you all for your information and interest. May you all have a happy and DXing Easter.

FM5WD QSLS via W3HNK.

KP2N cards go to K8OHC.

XV0SU says to QSL to Box 308, Moscow 103009, USSR.

4U1UN was operated by NA2K, and he will look after the cards.

PZ1BS says to QSL to Box 831, Paramaribo, Surinam.

S92LB QSL address is Box 147, Sao Tome.

YI1BGD says to QSL to Box 7075, Baghdad.

YV0AA will QSL via Box 2285, Caracas 1010-A Venezuela.

Notes Of Interest:

ZL1AMO: It was reported that ron would be active from this week for a two week stint on ZK2RW, but so far no sign of him.

Jarvis should start this weekend with the call of either AH3C/KH5J or AH3C/KH1J, from the 13th through to the 23rd. No reports so far.

XV0SU: Alex reports that Spratly should start up next weekend for a two week operation.

Remember the St. Peter and St. Pauls Rocks operation last year signing ZY0SY? They had only 37 contacts before their computer blew up. So far they have received only 22 cards. If you worked them and have not received a card, send your request to Natal DX Group, CP597,
59021 Natal RN, Brasil.

Nothing has been heard from Burma as yet. Keep your fingers crossed.

Have a happy Easter with lots of good DX.

GL DE DX1 (VK2SG) VIA TG9VT.

SB DAYTON @ RTTYDX $KT7H0413

Digital Suite at Dayton!

BID: $KT7H0413

Looking for a place to meet fellow packet and RTTY hams at the Dayton Hamvention? On Friday night I will be hosting the Digital Suite in room 425 at the Downtown Stouffers. This will also be a place for USENET and Fidonet (landline BBS) hams who have been looking for a Dayton meeting spot.

This will be for Friday night only, BYOB, non-smoking. If you forget the room number (425), look for signs next to the elevator in the lobby.

DON'T FORGET! STOUFFERS, ROOM 425, FRIDAY APRIL 27TH!

73,

Tad

I like the idea! I would be in support of such a project. There are some issues, however ....

1. Since it is Amateur radio, there will certainly be some antenna height restrictions imposed <g>
2. Since it is Amateur radio, it will be the first thing to be blamed for TV problems everywhere.
3. Unless it is promoted well, everyone will call it a CB.
4. It will be necessary to have a control operator onsite.
5. How do you handle phone patches? MCI would like a per mile charge for long distance.

- keep us posted on your proposal status ...

Do the people who invent these snake-oil audio scams ever get rich?
I was just thinking that exposure of some speaker wire to intense radiation
might shoot some imperfections into the crystal lattice, to create more
conduction between layers of copper atoms. Just the thing to get a deeper,
more thundering bass and to sharpen the points on those highs.

I have a TS930s with antennae tuner. Lately, as I am sending cw I have noticed that the ALC starts to drift lower so I turn up the carrier and it keeps drifting down until I lose that ALC. Can anyone give me any suggestions as what to look for or do? PS: I have never had to turn the carrier up to maximum. Sooner or later I fid a point usually a little over half way where the length of the QSO is less than the drift. Also, if I do not key the transceiver for a while the ALC is up to high and I have to turn the carrier down. I have soem ideas about the problem but I would like some other opinions. Thanks!

ALL BAND PORTABLE RECEIVER
You might wish to give the Sangean ATS-803A a try. Sangean has come a long way over the past year. This portable --generally-- lists for around $189.00. Complete with keypad, memories, BFO and clock. Also manual tuning as well as "keypad tuning." An excellent performer for the price. This --of course-- is just my opinion.

P.S. Digital frequency readout is standard.

USENET MEETING PLACE AT DAYTON HAMVENTION

It's that time of year again! Year after year we see postings on USENET asking, "Where can USENET radio afficinados get together for an old fashioned eyeball at the Dayton Hamvention?"

In 1990 we have a place of our own.

Come to the Digital Suite on Friday, April 27 at the downtown Stouffers Hotel, room 425. I have a large suite reserved for packet, RTTY, USENET and Fidonet hams, so we can all get together and see what each other looks like (scary!).

This is at Stouffers, where many of the DX clubs host the infamous hospitality suites. . .where you can gab with famous DX and contest hams until the wee hours. And now we have our own hospitality suite!

Show up after 8pm, room 425, downtown Stouffers in Dayton, April 27th.

BYOB and non-smoking, please.

See you there!

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

MONDAY APRIL 16, 1990

SpaceNews is published and distributed weekly around the world on USENET and Amateur Packet Radio. It is available for unlimited distribution.

* RUDAK-2 *

RUDAK-2 has now been integrated into a Soviet Geological research satellite, GEOS, scheduled to fly in July. RUDAK-2 will not only carry a Mode B linear transponder but also a variety of packet radio experiments with data rates from 400-9600 bps using various modulation schemes. It will be compatible with AX.25 protocols and those amateurs equipped for FO-20, PACSAT, LUSAT, AO-13 PSK telemetry, and UO-14.

Linear Transponder Uplink: 435.030 - 435.120 MHz (90 KHz)
Linear Transponder Downlink: 145.880 - 145.970 MHz (inverted)

O/P Power: 12 watts max.
Beacon : 145.880 MHz, CW telemetry.

Gain of satellite RX/TX antennas: 2.3 dBi each (dipoles)
Input sensitivity: -125 dBm (435 MHz) for a C/No of 45 dB/Hz

SAT-RX-1: 435.016 MHz +-10 KHz 1200 bps, FSK, NRZIC/Biphase-M (JAS, PACSAT)
SAT-RX-2: 435.155 MHz +-10 KHz (AFC) 2400 bps, BPSK, Biphase-S
SAT-RX-3a: 435.193 MHz +-10 KHz (AFC) 4800 bps, RSM, NRZIC/Biphase-M
SAT-RX-3b: 435.193 MHz +-10 KHz (AFC) 9600 bps, RSM, NRZI (NRZ-S) +Scrambler
SAT-RX-4: 435.041 MHz +-10 KHz (digital AFC) RX for RTX-DSP experiments

The downlink can be switched to the following operating modes:
Transmit frequency: 145.983 MHz

Mode 1: 1200 bps, BPSK, NRZI (NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (AMSAT mode for OSCAR-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S (planned for OSCAR-13)
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) + Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)
Mode 7: FSK (F1 or F2B), e.g. RTTY, SSTV, FAX, etc. (only for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (e.g. speech)

RUDAK-2 is a joint project of AMSAT-U-ORBITA, the Adventure Clubs in Moscow and the AMSAT-DL/RUDAK Group in Marburg, Munich and Hannover.

[From DB2OS and DJ0HC/KE6MN via OSCAR-11]

* STS-31 NEWS *

NASA managers set April 25 as the new target launch date for STS-31. This date is based on the decision to remove and replace Auxiliary Power Unit (APU) No. 1 on Space Shuttle Discovery and to allow time for recharging the Hubble Space Telescope (HST) batteries. The decision to replace APU #1 comes after examination of the APU controller by the manufacturer, which verified that no problems existed within the controller.

A new APU will serve as the replacement APU on Discovery. The recharging of the HST batteries will be accomplished by removing the batteries from the telescope and charging them in a laboratory. This allows the batteries to be serviced under the most favorable conditions while HST remains in the clean environment of the shuttle's cargo bay.

[From: Ron Baalke @ The Jet Propulsion Lab]

Dayton is getting closer. Here are the suggested frequencies whereby rec.ham-radio and info-hams people can communicate. Of course there will be lots of QRM especially at the Hara Arena on 2 meters. Three frequencies are suggested just in case someone is stuck on one band.

223.600
445.600
145.600

If you can get on 223.600, that should be the first place to try. Second will be 445.600, and finally if you must and can get through, go for 145.600. The first of these frequencies was suggested a while back and I added the UHF suggestion then. With this posting I am adding the 2 meter suggestion for those stuck on that band.

PL 118.8 (2B)

If you can transmit a PL/CTCSS tone, I suggest everyone use 118.8 hz (2B). That way those of us who can do tone squelching can cut out some of the QRM. This will be especially useful for those who are stuck on 2 meters.

Outside of the Hara Arena, simplex might not hit everybody. Perhaps you can try all three bands depending on your capabilities. The fallback is to call on repeaters. I suggest the primary keyword to say and to listen for be "usenet". Others such as "rec ham radio", "fidonet", and "info hams" might work, but might also be a bit more misleading to others. Due to the low number of repeaters for the significan ham crowd in Dayton, suggesting a particular one would probably be futile.

VHFers:

The W9IP/BCN Aurora beacon has changed frequency. It is now transmitting in the new 2-meter beacon band, at 144.294. Please pass the word to other VHFers who might use the beacon for Aurora propagation monitoring.

The beacon runs about 40 watts output, CW, to a 5-element beam which is pointed north. The site is on a fine hilltop about 10km from my QTH in Canton, NY (grid FN24). Transmission is unattended, signing "de W9IP/BCN FN24" followed by about 5 seconds of tone. The signal has a slight chirp. Reception reports are welcome.

If one of the astronauts is a ham, maybe he might have the repeater pair put into his spacesuit radio, for occasional ragchews? Of course, he can't spend much time talking, he has his work to do.

To: REC.HAM-RADIO
Re: RFI to Home Entertainment Apparatus

If the guy is using coax to go to his speakers, run the coax through a paper towel tube (core), placed as close to the speaker as possible. Cap one end of the tube and then fill the tube with metal filings &/or steel wool. Then cap the other end. This should make a fair RF choke (see page 40-6 in the 1990 ARRL Fanbook, Fig. 6 for an idea of how this may look. Chapter 40 is the Interference section.) I have done this, and the more metal you can pack in around the coax the better. Also, line the inside of the speaker with metal sheilding of some kind. Tom Nofsinger, N5FHZ.

I am looking for an old friend of mine whom I lost
contact with 8 years ago while I was living in Korea.
His name is Geert and his Belgian call-sign was ON7LG.
He was working with ITT as an system engineer in Korea.

Could anyone who knows him help me to meet him again?
Please e-mail me if you could help me.
Thanks. 77&88.

I will shortly be moving to Rochester, Minnesota (about 80 miles south of Minneapolis/St. Paul, and I was wondering how active the local packet community there is. If anyone out there is from around that region, please e-mail me with some info. Thanks.

I would like to get in touch with any hams who have experience with mods on the Kenwood TM-701A dual-band mobile radio. Please e-mail.

Someone in Japan sent me the April Issue of CQ Ham Radio. It came with
a small booklet Called "HAM Packet Radio News". In page 8 of this
booklet there is an English headline thats says:

Packet Radio in JA    N3EUA Bdale Garbee

The rest of the page is in Japanese hieroglyphics. Is this the same
Bdale as posts to this news group? Does he write in Japanese?

I think we should be told.

Yours

Can someone please post a listing of the frequencies of the polar orbiting weather satellites? Ones of interest include the NOAA series and the METEOR series as well as others in the 137mhz band.
Thanks

A couple of years ago I paid $2.00 for a brand new Lear Siegler "Earcom" control box. It was such a deal, I couldn't pass it up, even if I didn't have a radio to use it with. It came in a Poly bag, but had no documentation or wires.

An Earcom is a device much beloved of SWAT teams and the Secret Service. It uses an earpiece of the "Shove it in yer ear" type that was the standard when hearing aids had tubes. The earpiece is connected to a belt mounted box (The Earcom unit). The Unit is then plugged into a walkie-talkie. Now you can hear in the earpiece, and when you want to talk, you push a momentary toggle switch which keys the radio and allows the earpiece to be used as a mike. I don't know how bad these things sound. I am pretty sure that they would be amusing in VOX mode cos burps, swallows etc should key the mike.

Anyhow, I do not have the earpiece, I need specs or a source. I would also like the pinout for the 4 pin Amphenol connector that seems to go to the radio. The earpiece would plug into an RCA audio jack. The thing seems to be powered by a standard 9V battery (PP9).

So if you have info, phone numbers, sources etc I would be delighted.

The Numbers on the Unit are: Model 1105 Serial 4981HW Logo is LSI.
Box is blue anodized aluminium.

QEX - The ARRL Amateur Radio Experimenter's Exchange

Gateway Column, Edited By Stan Horzepa, WA1LOU, April, 1990 - P 1 of 5

NEW TNC 2 FIRMWARE AVAILABLE

Tucson Amateur Packet Radio (TAPR) released TNC 2 firmware version 1.1.7. This new firmware release offers significant changes and enhancements including:

- Prioritized acknowledgment (PriACK) protocol

- Improved channel access methods (similar to "persistence")

- Improved compatibility when running AX.25 V1 (T3 may be disabled)

- Filtering to inhibit monitoring of NET/ROM, ROSE, TCP/IP and other networking packets

- Improved transmit timers (time- and/or character-based) and quick-release of PTT at the end of a frame

- Pre-frame synchronization of zeroes instead of flags for reduced TXDELAY

(to permit other stations to lock onto your transmissions faster)

- No dead-time between frames during multi-frame transmissions
- Improved KISS operation in the full-duplex mode (for Microsat and other applications)
- Improved RR/RNR buffer to provide "full-handling" for less channel congestion
- Improved modem demodulator calibration facilities
- Additional error (Health) counters
- Documentation of the format and location of the default parameters in EPROM for those who prefer a custom EPROM instead of trusting battery-backed RAM for remote site locations

Details of this new release of firmware is available from TAPR at PO Box 12925, Tucson, AZ 85732, telephone 602-749-9479. The firmware is also available as a binary file that may be downloaded from CompuServe's HamNet.

from Lyle Johnson, WA7GXD via CompuServe's HamNet

PACKET-RADIO SATELLITES STATUS REPORT

DO-17 Popular On 2-Meters; AO-16 and LO-19 Cross-Band Digipeating

Week seven at the AMSAT satellite factory finds each satellite closer to full commission for general use. DO-17 continues to excite newcomers to the world of amateur satellites with its ease of telemetry reception. Anyone with a 2-meter FM receiver tuned to 146.825 MHz, a 1/4-wave ground-plane antenna, and a standard TNC can receive telemetry packets from DO-17. By listening from 0800 through 1300 and 1900 through 2400 local time, several DO-17 passes may be monitored.

DO-17 transmits packets for approximately 2.5 minutes followed by an "off period" of approximately 30 seconds. As is true with each of the Microsats, the telemetry offers 59 telemetry points and the AMSAT Software Exchange has programs available that translate the data points into more easily recognizable information, ie, battery voltage, solar cell current, etc.

AO-16 and LO-19 have been available for digipeating packets. Numerous stations have successfully connected to "DX," as far as VHF-packet-radio operations are concerned, via these two birds. The store-and-forward capabilities of AO-16 and LO-19 have yet to be enabled, pending further testing.

The modulation protocol on these two birds requires using an external 1200-baud PSK modem instead of the FSK modem that is standard in commercial TNCs. To access AO-16 or LO-19 requires approximately 100-watts EIRP FM. Your downlink receiver must be set to USB or LSB. To digipeat through AO-16, you must use the address "PACSAT-1"; to digipeat through LO-19, use the address "LUSAT-1." The downlink and uplink frequencies of AO-16 and LO-19 are as follows:

AO-16:
downlink 437.025, 437.050 MHz
uplink   145.900, 145.920, 145.940,145.960 MHz

LO-19:
downlink 437.150, 437.125 MHz
uplink   145.840, 145.860, 145.880, 145.900 MHz

First TCP/IP Microsat QSO?

Bob McGwier, N4HY, and Jon Pearce, WB2MNF, lay tentative claim to the first Microsat TCP/IP QSO. They were on the 0307 pass of LUSAT on March 3. Since they were both calling each other, they had two Telnet and one FTP sessions. To use the satellite as a digipeater, the NET ARP entry is ARP ADD (your call sign) AX25 (your call sign) LUSAT-1 (for LUSAT, of course). You also need a ROUTE for (your call sign) to your KISS port.

PACKET-RADIO SATELLITES STATUS REPORT (Continued)

WO-18 Shoots The World

Chris Williams, WA3PSD, reports that the Ground Command Station at Weber State University (WSU) is receiving pictures from space daily. This past week, the best picture taken was of the coastline of British Columbia near Vancouver Island. Since Weberware 1.0 can recover the color in pictures from the imaging data stored in memory, the oceans show up with the proper hues as seen by the camera. Initially, it was difficult for the WSU students to pinpoint the area snapped by the camera, but checking the satellite tracking software and the time the lens shutter was opened, they figured out that it was the BC coastline. The camera on WO-18 can only take a 170-square mile picture when looking straight down, so, at times, one has to be very good at geography to figure out what the pictures represent.

The integration of horizon sensor readings into the picture taking software on-board WO-18 will indicate when the satellite is pointing at the earth. The software is being changed so that pictures will only be taken at those times. This will mean an end to pictures of deep space or the sun.

WO-18 may be heard on 437.100 MHz (+/- 10 kHz for Doppler shift). The alternate frequency is 437.075 MHz.

WA3PSD also announced that the beta test version of the picture processing software, Weberware 1.0, will be sent to a group of carefully chosen software testers, who will perform intensive checks of the software. If no major bugs are discovered, radio amateurs can expect Weberware 1.0 to be available from the AMSAT Software Exchange approximately the first week of April. WA3PSD wants to emphasis that the priority at WSU is taking care of WO- 18. Second priority is getting the image processing software finished. The students at WSU are working as quickly as possible to get this very complicated program into a user friendly state. Weberware 1.0 will run on IBM\R AT clones equipped with EGA or VGA monitors.

Because of the instant popularity of WSU's efforts in building the Webersat, many grade school and high school students from the greater Ogden and Salt Lake City areas are showing up at the Ground Command Station to experience the care and feeding of an OSCAR satellite. The WSU students have enthusiastically embraced the job of explaining to all the finer details of WO-18 and its many on-board scientific experiments. Hopefully, many of these young people will not only become interested in Amateur Radio, but also start thinking about space.

The Webersat team encourages all radio amateurs to continue to save picture data and telemetry from WO-18. To receive a beautiful QSL card from WSU, send your QSL card, a copy of WO-18 telemetry and an SASE to Chris Williams, WA3PSD, Eng Tech Bldg, #236, Weber State University, Ogden, UT 84408-1805.

FO-20 In Full Mode

FO-20 is now operating in "full mode," ie, both transponders (JA and JD) are functioning. If necessary, the transponders will be shut down on Wednesdays. If the JD transponder are shut down, all posted messages will be discarded without warning.

UO-15 Problem Undergoing Diagnosis

Volunteers at the Stanford Research Institute (SRI) have been working with the University of Surrey (UoS) to find what is preventing UO-15 from downlinking telemetry. Martin Sweeting of the UoS reported that SRI is making a 150-foot dish antenna and its sophisticated signal processing equipment available to figure out if any of the sub-systems on UO-15 are still operational. SRI has aided UoS in the past by using the same dish to uplink a signal of "sufficient strength" to overcome the desensing of UO-9's command receiver by its 2-meter transmitter.

SRI is trying to receive the local oscillators' signals on board UO-15. The calculated received signal strength of UO-15's LOs is approximately -160 dBm. A trial run receiving LO signals from the healthy UO-14 was successful, although it required signal analyzers using FFT techniques to provide a 1-Hz resolution bandwidth over a 5-kHz bandwidth to discern the signals. SRI now will try to locate UO-15's LO signals and, from the results of those efforts, the UoS's engineering team will determine if it is possible to "pull the cork" on UO-15's transmitter.

from AMSAT News Service, CompuServe's HamNet, and Jon Pearce, WB2MNF

TAPR ANNUAL MEETING REPORT

The annual meeting of Tucson Amateur Packet Radio (TAPR) occurred on February 24-25 in Tucson. The board of directors met on February 23 and announced the results of the election for the board with the following members being elected to three-year terms: Tom Clark, W3IWI; Pete Eaton, WB9FLW; Don Lemley, N4PCR; Harold Price, NK6K; and Dave Toth, VE3GYQ. The board also selected the following as TAPR's officers for one year terms: Lyle Johnson, WA7GXD, president; Harold Price, NK6K, executive vice president; Bob Nielsen, W6SWE, vice president/member services; and Greg Jones, WD5IVD, secretary/treasurer.

Saturday morning, there were talks on Microsat by Doug Loughmiller, KO5I; TAPR version 1.1.7 TNC 2 software by Lyle Johnson, WA7GXD; TCP/IP by Phil Karn, KA9Q; HF packet-radio diversity by Steve Hall, WM6P; high-speed networking by Bdale Garbee, N3EUA; and the OMNITRACS communications vehicle by Franklin Antonio, N6NKF. The afternoon session had talks on TexNet by Harry Ridenour, N0CCW, who mentioned that TexNet is now available as firmware for the TNC 2. Other topics included Great Lakes (GL) Net by Jay Nugent, WB8TKL; a 56k-bit/s repeater by Doug Yuill, VE3OCU; ARRL happenings by ARRL Southwest Division Director Fried Heyn, WA6WZO, and ARRL headquarters' Jon Bloom, KE3Z.

Amateur Radio manufacturers in attendance also made presentations. DRSI presented their K3MC "Awesome I/O Card," a 56001-based DSP PC packet-radio card, which will operate at 24 MHz. It includes a 16-bit A/D converter on-board and will cost approximately $400. PacComm talked about their PSK-1 modem, which is a fully-assembled modem for satellite work, and the G3RUH modem. Kantronics presented their Data Engine (DE), the DVR 2-2 VHF transceiver, and the 2/70 power amplifier for the DVR 2-2. WA7GXD reported on the progress of the TAPR packetRADIO.

Outgoing TAPR president Andy Freeborn, N0CCZ, closed the meeting with the financial report for 1989. Afterward, Pete Eaton, WB9FLW, presented Andy with a plaque from TAPR expressing the organization's appreciation for all Andy's work over the years and especially for his service as president.

from Andy Freeborn, N0CCZ, via CompuServe's HamNet,
and Steve Goode, K9NG, via The CAPRA Beacon

SAREX-2 TESTED

In late February, the Shuttle Amateur Radio Experiment #2 (SAREX-2) packet-radio station underwent extensive testing at the Marshall Space Flight Center in Huntsville, Alabama, according to AMSAT Area Coordinator Ed Stluka, W4QAU. This testing was in conjunction with the training of STS-35 Payload Specialist Ron Parise, WA4SIR, in the use of the ASTRO-1 experiment, which will be primary payload on that shuttle mission. The primary payload, ASTRO-1, will be used to conduct astronomical experiments. During several days of testing, radio amateurs in the Huntsville area were able to connect to WA4SIR and to receive a QSO number.

This special packet-radio station will fly on STS-35 on May 9, 1990, and will give each radio amateur who connects to WA4SIR a QSO number confirming the contact. When the connecting station sends in a QSL card and the contact number, the station will receive a beautiful QSL card commemorating this "Ham In Space" shuttle flight.

The SAREX-2 packet-radio station has a Motorola 2-meter FM handheld transceiver with 5 watts output, a Heathkit HK-21 TNC 2, and a Grid laptop computer with a 40-Mbyte hard disk drive to store the calls of the stations connecting to WA4SIR during the nine-day mission. The specially written software, which will be running the SAREX-2 packet-radio station, allows completely unattended operation and logging of the calls of the connecting stations. It will also prevent duplicate QSO numbers from being sent.

Although no digipeating will be allowed through SAREX-2, connecting to this packet-radio station will be like any terrestrial packet-radio contact. Just use your TNC with your 2-meter transceiver, and everything else is the same. After you have connected and received your QSO number from WA4SIR, on subsequent orbits you can monitor the SAREX-2 message beacons that will be sent periodically. The message beacons will contain information about the flight of STS-35 and other interesting items.

QEX - The ARRL Amateur Radio Experimenter's Exchange
Gateway Column, Edited By Stan Horzepa, WA1LOU, April, 1990 - P 4 of 5

PACKET-RADIO DISTRIBUTED BBS OPERATIONAL

The February issue of the Association of Computing Machinery's Communications features a long article from a group at MIT who have implemented a "distributed" BBS as a "Community Information System" (the Boston Community Information System or BCIS) using packet radio and personal computers.

The way the system works is simple. Data from The Associated Press, the New York Times and even feeds from USENET are "broadcast" via an SCA subchannel on a local FM broadcast station at 4800 bauds using FSK. Local packet-radio adapters (TNCs) receive the data using a protocol that is much simpler than AX.25 or TCP/IP. They pass the data on to the user's personal computer, which sees if it is of interest to the user by checking it against a "filter" list generated by the user. If it qualifies, it stores the data on the personal computer's disk and the user can retrieve it using database-style query techniques. This process is called the "simplex" portion of the system, which overall is called a "polychannel" system.

Should a user query for something not in the local disk database, an autodial modem accesses a "local" database server to ask for the requested information (this is the "duplex" portion). Because the local users have no authorization to initiate transmissions on a commercial broadcast channel, dial-up modems are used.

The idea sounds a lot like the distributed ham PBBS in use in Japan. Which leads us to the $64 question: why can't our local ham PBBSs work in a similar fashion with our current PBBSs becoming "servers" (and even gateways to USENET or the Internet)? These would be accessible directly by packet radio instead of dial-up modems and our local TNC/computer combinations would become the recipients of data of interest to us.

from Bill Meahan, WA8TZG

AMIGA, ATARI AND UNIX VERSIONS OF KA9Q'S TCP/IP SOFTWARE AVAILABLE

Version 900214 of the KA9Q TCP/IP software package for the Commodore Amiga computer may be obtained by downloading it from Data Library 9 (DL9) of CompuServe's HamNet. Its file name is AMIGAN.ZOO.

The latest PE1CHL release of the KA9Q TCP/IP software package for the Atari ST computer may be obtained from Mike Curtis, WD6EHR, 7921 Wilkinson Ave, North Hollywood, CA 91605-2210 by sending two blank double-sided or three blank single-sided disks, a postage- paid, self-addressed disk mailer and a note stating your needs.

The UNIX version of the KA9Q TCP/IP software package is available via anonymous FTP from host vax.cs.pitt.edu in the file pub/ka9q/net-unix.cpio.Z.

from Julian Macassey, N6ARE, and Bob Hoffman, N3CVL

W1HUE AND POLI CHANGE ADDRESSES

Larry East, W1HUE, the US distributor of "APR," the public domain packet-radio terminal program for the Apple\R II family of computers, has the following new address: PO Box 51445, Idaho Falls, ID 83405-1445. (APR may be obtained by sending Larry a blank 5-1/4 or 3-1/2 inch disk and a postage-paid, self-addressed disk mailer.)

Packeteers Of Long Island (POLI) have the following new address: PO Box 11, Jericho, NY 11753.

from Larry East, W1HUE, and Alex Mendelsohn, AI2Q

PBBS RESTRUCTURING

(The following is in response to Barry McLarnon's article entitled "Restructuring of the Packet Bulletin Board System Proposed" that appeared in the January 19 issue of Gateway.)

Barry McLarnon's article was right on the money. It points to something I have been after for several years, ie, adoption of the RFCQ822/1022/X.400 standard internal headers for packet-radio messages.

In the past, the From: and the PRMBS's reply To: fields have shown their usefulness. If we try to assemble our bulletin distribution system into a

USENET-like system, we need to add the field Newsgroups: to the internal headers. Also, if we can add a Keywords: field, if desired. The point is that we will not need massive software recoding each time we want to add a feature. We only have to add a field.

The PRMBS code already has "mail" and "message sweeper" functions that performs some of the "readnews" function of USENET. I only have to add code to allow it to select and reject articles by newsgroups.

For now, I suggest that we extend the To field. We can put in an internal header with a well defined (20 or more bytes long) field name for the newsgroup, eg, "space.amsat.microsat" or "space.amsat.dove," and use the convention of a major group name with a maximum of six characters, eg, AMSAT. A message that is forwarded to a system as follows:

```
        SB SPACE @ ALLUSA < N4HY $AMSQ700
```

would be rejected if a system does not want "SPACE" stuff (it would be nice to have the ability to reject subparts of that thread, but that cannot be done without the code getting cumbersome). The sending system does not have to know what newsgroups each system will accept or reject. Instead, the receiving SYSOP configures the system to accept/reject any group. It can be done better, but this is what is possible in the immediate future. (I could add and activate this feature into PRMBS in less than a week and it would have no impact on the network in terms of incompatibility.)

One problem is that in many areas there is insufficient decentralization and linear progressions for mail passing. If some SYSOPs decide not to accept a certain newsgroup, it would stop the distribution of the group. To avoid this, I would add code to PRMBS to allow generation of the redistributed messages, but hide the original from view on the rejecting system until those messages were fully distributed.

This turns us to the problem of network topology. We have to do more "hubbing," ie, getting more, lower powered stations clustered around one or two more powerful stations that talk to similar stations and distribute the mail on backbone channels and onto secondary backbone channels to clusters, who allow users to log on via a third channel.

from Brian Riley, KA2BQE

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail or or electronically, via CompuServe to user ID 70645,247 or via Internet to 70645.247@compuserve.com. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s. (Personal messages may be sent to your Gateway editor via packet radio to WA1LOU @ N1DCS or IP address 44.88.0.14.)

The deadline for each installment of Gateway is the tenth day of the month preceding the issue date of QEX.

I have been endowed with a small amount of end-of-budget-year money and would like to use it to buy a modem to decode the FSK transmitted by CHU. CHU transmits this using the (telephone) standard 2225/2025 Hz frequency pair at 300 bps.

I have built several modems to do this in the past from standard 300 bps modem chipsets with good results, but would like to improve on this. Can anyone recommend a commercial 300 bps modem which is explicitly designed for high frequency radio use?

Note that other than effective filters and some control over the carrier detect delay, I'm really looking for something quite stupid. Things like multimode packet controllers and the like probably wouldn't be suitable since I need something which introduces predictable delays. Good quality analog parts followed by very little in the way of digital circuitry would make me very happy.

Thanks,

Dennis Ferguson

Here is some CAP frequency info from the 88 Grove SW Directory. This is abbreviated.

MHz	regions/use
2.371	USA
2.374	USA
4.4645	1
4.4675	1,2,4
4.5045	8
4.5075	3,5
4.582	Emergency/Calling
4.585	2, Puerto Rico
4.5995	7
4.6025	3
4.627	6
4.63	6
7.635	1,3,4,5 and USAF
7.9185	1,2,3,5,6,7,8 and USAF
14.905	1,2,6,7,8 and USAF
20.873	4, Puerto Rico
26.62	USA

Regions:

1	Northeast
2	Middle East (actually Mid-Atlantic states)
3	Great Lakes
4	Southeast
5	North Central
6	Southwest
7	Rocky Mountain
8	Pacific

Net Control is KJ9885 (tac call HEADCAP) at Hamilton AFB, Alabama.

This is condensed. If you want callsigns and net schedules, buy
Grove's Shortwave Directory

The abbreviation "btw" stands for BY THE WAY, an American colloquialism
and figure of speech. I think in "British" the expression is "By the by."
I have no idea if there is a different equivalent Aussie expression.

I know this is a sexy idea at first glance, but I'm afraid that if you looked at it more closely you'll find that it's not as nifty as you might think.

First of all, it is almost certain that the US space station will be launched into a low altitude 28.5 degree inclination orbit (that is, if it is ever launched at all.) This orbit (which is also used by the majority of shuttle flights) requires the minimum energy to reach from Cape Canaveral. Given the proposed mass of the station you can bet they'll pick the most economical orbit possible.

Unfortunately, this orbit has very poor coverage of the continental US. Only the southern part of the US will ever see it more than a few degrees above the horizon, and of course passes would be quite short.

There has been a proposal for amateur radio aboard the space station, but it would be for a Phase IV *user* station, not a repeater. In other words, amateur radio would have its own TDRS system. This would give nearly 50% coverage with just a single satellite.

If you want to talk through a repeater in space, there are already plenty
up there to choose from, and they are in much better orbits than that
proposed for the space station. Oscar 10, Oscar 13 and FO-20 have analog
repeaters, and of course there are also the microsats for digital
communications.

According to my Castell's German Dictionary, Litzendraht is "stranded
wire, flex.". "Litze" means "braid,cord,lace,piping;strand (of wire)."

Several have sent me messages on this subject. I have tried to respond directly but guess I cannot figure out my E-mail system. Here is what I was trying to send.

I am no expert on multi-mode tnc's, but I can relate what little I know. I have a PK-232 and use it on packet and RTTY. The PK-232 coupled with the Pakratt software is very easy to use on packet and works quite well. Some purists have found problems with the PK-232 on packet, but I have not experienced problems at my level of useage. The PK-232 and software also work well on RTTY (I include Baudot, ASCII, and AMTOR in this category) but actual performance is a bit of compromise. The PK-232 does not use the standard 2125/2295 tone set for 170 Hz shift. It uses instead 2110/2310 for 200 Hz shift. Purists argue that this compromise tone set hurts the PK-232 in weak signal detection, etc., but in most situations performance appears normal. I suspect that in a pile-up a good detector will pick out the true tone set easier that the 200 Hz tone set--meaning that the compromise occurs at both the receiving and transmitting ends. I have seen few cases where I think the PK-232 let me down. There are lots around, they are well-supported, and the software is very good.

The KAM, with which I have no direct experience, appears to be a very nice unit, and a very small unit. The tone sets are true and they look (on a scope) and sound great over the air.   I have heard nice comments about the KAM. I have also heard that it takes a while to learn to use it and the related software, but that may have been an isolated opinion. If I were buying a multi-mode tnc today, I would seriously consider the KAM---but I would solicit first hand info from KAM users before going ahead. Seems there are AEA people and there are Kantronics people and they are heavily polarized. Word on the street is that Kantronics really knows their stuff, and they are very helpful if you have to call for assistance.

Hope this helped. 73, Steve , K4FJ.

I want to know if there are standards for the manual coding of Morse code.
In particular, what are the dot, dash, inter-character and inter-word
lengths.

Sorry if this is a well-known question -- I'm not a ham.
Please E-mail your replies, as this is probably not of general interest.
Thank you.

I'm curious if anyone has tried to insure a repeater. I would have to pull a
figure of $5,000.00 out of the hat. The dollars invested doessn't quit make
the limit, but the hours, hours, hours are not reflected in bucks. If our box
were to receive the wrath of the Gods, I would go simple simon with a rice-box
repeater and an 850 controller. 5K would not go far.

I passed! The biggest problem that I had with the test was that it didn't
start out with the sending station sending 'CQ CQ CQ ...'. Instead, it
started out with the recieving station responding to the CQ and giving his
name. My computer program always started out with CQ. Even the Kenwood
starts out with CQ! Well, by the time I figured out what was going on I
had missed quite a bit. Fortunately they didn't ask for the call signs or
I'd be taking the test again.

>

Far be it from me to deny you your 1st amendment rights but IMHO it can't be a heck of a lot less than the drivel that ARF and its attendees espouse on that net. My boss was at my house and his son wishes to be an amateur. That anti-semitic drivel made an excellent introduction to amateur radio. I beat a hasty retreat to the OSCAR satellite, where I work three satellites in four different modes in 30 minutes. Thank god there is some intelligence in ham radio someplace.

The birds sold the kid in fifteen minutes. DAMN why can't people keep their stupid prejudices to themselves and off ham radio.

Bob

Brad Lupton's story about trying to fix a bad potentiometer is all too true; and I'm sure most of us have encountered this problem at least once.

The problem with today's stuff, and especially with the Asian products, is that the things are just simply cheap-cheap-cheap!   Few pieces of equipment outside mil-spec stuff can afford the luxury of the old A-B pots that would work virtually forever. I have an expensive color TV from one of Japan's premier TV manufacturers, whose pots (every one!) have become noisy after a just a couple of years. AND SOME OF THEM SELDOM GET MOVED.

The noise and scratchiness is caused by the wearing-away of the carbon deposited on the pot itself. Continuous friction of the sliding contact on the carbon weait away. Cheap pots with thin coatings, poorly-deposited coatings, poorly-prepared coatings, or incorrect slider pressure and design give it up very quickly.

It is unfortunate, but the only remedy for the problem is just to replace the pot. Spraying them with tuner cleaners and solvents more often than not make the problem worse by causing the resistive material to further erode and melt away. Remember, these solvents are made to clean metallic contacts in switches and are pretty potent.

When your pots start giving you problems, they are worn out and need replacing. And be very careful what you spray into your expensive, quality pots.

73,
Dube Todd   N5PDK

I had to smile when I read this. The computer used was a Cray which
compared to a C64 is like comparing roller skates to a Porsche 959 and
even that may be too narrow a comparison.

Yeah, I got a revised page 2 as well. It seems that they found it necessary to tell the installer to be sure and remove the sticky protective shipping plastic from the front of the display. I suppose it would look awfully funny if you didn't. I wonder how many people forgot to :-).

The display kit is very nice, and pretty simple. The whole affair measures about 1.5" by 3" by half an inch thick. Only one flat ribbon cable to solder in place, and it has about 10 conductors on it. The tricky part is that they're about 2mm apart and must be float soldered onto the pads on the circuit board. Getting the old one off was no sweat (of course!). I'm pretty handy with a soldering iron and was able to do it using a 40-watter. A finer tip would'a been nice but a little patience was all it took. Total replacement time cover to cover was about 30 minutes.

The new display is completely readable in open sunlight, even when the operator is wearing sunglasses. There is still a small problem with glare from the shiny glass (plastic) window faceplate, but I'm sure that many rigs must have this problem too. At night, I find it almost too bright and am glad that the panel dim function is available.

I'm really pleased with Kenwood on this affair. They recognized their mistake and they are selling the fix for next to nothing. The replacement display contains the complete LCD panel with controller chips and driver circuitry. As an ordinary replacement part one could imagine that it would cost a lot more.

I've heard that HRO will send your rig off to Kenwood and let them do it all for $50! Given the cost of everything else these days, I consider it a bargain.

BTW, someone mentioned recently that their TS440 had a cheap screw-in SO-239 connector on the back that spun around and shorted out their rig. My brand-new TS-440 has the regular, old-style SO-239 with the square plate and 4 screw holes (only 2 screws in, however :-). I'll stand by Kenwood, since it's evident that they do listen to their customers and they do make reasonable attempts to correct their mistakes. Incidentally, I'm told that the TS-440 is now the best selling HF rig of all.

ANNOUNCING THE 1990
MASSACHUSETTS QSO PARTY

DATE/TIME: 0000Z 5 May 90 to 2400Z 6 May 90

OBJECTIVE: Work as many hams in as many Massachusetts counties as possible during the 48 hour period.

MODES: CW, and Phone (No cross-mode, repeater or packet contacts)

BANDS: All amateur frequencies from 160 meters through 10 meters.

SUGGESTED FREQUENCIES:
CW: 15 kHz up from the bottom of the General class subbands (eg., 7040, 14040, etc.)
SSB: 25 kHz up from the bottom of the General class phone bands (eg. 3875, 7250, 14250, etc.
ALSO: Novice & Technician subbands:
80/40/15/10 meter CW
and 10 Meter Phone (28.315)

EXCHANGE: RS(T) and:
Massachusetts Stations: County
All others: State, Province,
or Country (DX)

OTHER: Work stations once per band and mode. MA to MA contacts are allowed. Portable or mobile MA stations may be worked again if they change counties.

SCORING:
1 Point per phone contact
2 Points per CW contact
5 points if you work club station W1TKZ

Multiply to points by the multiplier

Multiplier for MA stations= total number
of states, provinces, DX countries and
MA counties.

Multiplier for non-MA stations= number
of MA counties (max = 14)

SUBMISSION: Logs to WARS by 06 Jun 90.

SPONSOR:
Wellesley Amateur Radio Society
MA QSO Party
211 Washington Street
Wellesley Massachusetts 02181

>John Kirby

I have not tried a Visitel on the radio but I have serious doubts that it could ever work. The details of the transmission format are a little fuzzy in my brain but here is what I recall.

The image starts with a digital header containing synchronization & calibration signals and information about the image size. After this there is NO horizontal sync as in most ham SSTV formats.

The picture is composed of 96 x 96 pixels of 32 gray levels. The pixel rate and audio carrier frequency are both 3579545/2048 per second. Gray levels are conveyed by a combination of phase and amplitude modulation. 2 phases (180 degrees apart) and 16 amplitudes. Each pixel is one audio cycle. Black and white are both full amplitude and opposite phase. Gray levels are lower amplitude with medium gray being the lowest amplitude.

This is fine for a phone line or FM radio. Let's perform a thought experiment about what would happen on SSB ...

Suppose your tuning was off by 20 Hz. The receiving end expects one pixel per audio cycle and would gather the pixels at 1727 or 1767 per second while the sender is producing them at 1747 per second, producing a badly slanted picture. The phasing of one pixel per audio cycle would be all messed up. QSB of propagation and AGC of the receiver would also corrupt the amplitude modulation of the audio carrier.

Several people have proposed using the Visitel for HF SSTV but I have never heard of any success. I would be very interested in hearing more about people's experiences with it.

If you would like to try SSTV at a low cost use your home computer.

* AEA has an interface for the Amiga for about $300. I've never seen this in operation but it sounds very impressive from everything written about it.

* SPEC-COM has SSTV software for the Radio Shack COCO. I think it was about $40. This might be related to the article in the November & December 1984 issues of 73 Magazine.

* A color SSTV program for the Atari ST is available from several user groups. It requires a simple interface that can be built for about $7. See 73 Magazine, December 1989 and January 1990.

  Even if you're not interested in the Atari ST, you should get a copy of this article. It contains a brief tutorial on how color pictures are transmitted and pointers to other sources of information on ham TV.

* I have a vague recollection of a product for the IBM PC from a company named something like Computer Systems Consulting. But it was only black & white. You don't see too many B&W pictures anymore.

* See QST, August 1985, for information on SSTV for the old 8 bit Atari computers.

* There are probably others which weren't well publicized.

In summary,
- The Visitel is not compatible with any of the ham SSTV modes.
- The Visitel modulation scheme can't be decoded by the usual Frequency to Voltage demodulators.
- I seriously doubt the Visitel would work over an SSB radio because it was designed for a communication medium with much different properties. (Please, someone - prove that I'm wrong!)

Color SSTV can be very expensive but it doesn't have to be anymore. If you must have 262,144 colors, spend $1295 on a Robot 1200C. If you want to make only a small investment to try something new and interesting, use one of the systems based on a home computer.

I'm looking for any mods that are available for the 3210A. Would like to
1) outband the transmitter
2) enable the cross band repeat function

```
3) expand receive as far as possible
4) whatever else is available!

Any help/guidance/direction appreciated.  Can ftp if files already available
elsewhere.

Prefer email to keep down bandwidth.  73 de Gary.

Also, in the market, check out #2409. We are in the second row, behind
Radio's Hack.

Since it is outdoors, you can smoke. I however reserve the right
to walk away if you get it near me, however...

CU there....

An incredible weekend of Pirate activity was logged on Los Numeros beginning
at 2345 UTC on 4/14 and extending through 0345 UTC on 4/16.  Sixteen (!)
different Free Air Broadcasters were logged with various snippets of
programming, signal strength and antenna heading tests, and plain old
ordinary kibbitzing on 7415 kHz.

Logged were the following stations:

        WRFI (Radio Free Intelligence)          East Coast Pirate Radio
        WXZR                                    Radio Gannymead (?)
        The Revolutionary Voice of Plainville   KBFA
        Radio USA                               Samurai Radio
        Voice of Monotony                       Voice of the Mountains
        Rockabilly Radio                        Radio Outlaw
        East Coast Beer Drinker                 Radio Free Papacia (?)
        4th of July Radio                       WPRA

Programming was relayed across the country to others participating in the
Teleconferencing who were unable to 'hear' in the classic sense.  What
an event!!

Yes, if you recall, the way Alf originally chose Willie Tanner's garage
to crash into in the pilot episode was the Willie made contact with Alf
on his Ham radio.  I forget the exact story, but I think Alf was having
trouble with his spacecraft and sent out a distress signal which Willie
picked up.

>Can anyone suggest sources for a down converter for GOES reception ?

Spectrum International, Inc.
POB 1084
Concord, MA 01742

1691-LY Loop Yagi Antenna, $75
MMG 1691 Preamp, $250
MMK 1691 1691->137.5 MHz downconverter, $330

As you can see, it's expensive. You will also need an AM demodulator;
a PK232 won't work.

>I currently
>intercept the GOES photos from 8080 Norfolk WX and haven't found other
>sources.

Those pictures are originally from GOES TAP, a leased phone line / commercial satellite service. I'm not sure what the direct GOES pictures look like, though they are available. I don't know how well the Loop Yagi works; I've never found anyone who had one and used it (only a few people who said they had them but hadn't started using them). The Spectrum International antenna is supposedly hard to build: it consists just of aluminum pieces that you have to bend into loops and fasten onto the long "pole" of the antenna at the proper places. The NOAA bulletins say you need a dish antenna for GOES. I'd be interested in hearing from anyone who uses the Loop Yagi with GOES.

You might want to try receiving pictures directly from the polar satellites when they go by overhead; it costs a lot less and requires a much smaller antenna. You also get much better detail (because the satellite is so much closer), although without the superimposed maps.

>I would like to receive wirephotos, but I am unable to locate a
>frequency for this that is active. I am located in New England.
>Thanks in advance for your comments.

There used to be an AP station in New England that sent wire photos, but it seems not to work any more. There used to be a station from Buenos Aires that sent news photos; the station was for DyN (Diarios y Noticias) and had a logo that looked like a thumbprint. They were on 11451.00 at 0200Z on 5/7/88, the last time I logged them. I heard what sounded like a Press Fax station on 5149.41 on this past March 28th while trying to find TDM stations, but didn't try printing it.

Press Fax frequencies I used to have in my radio:

17673.70	LSB	AP, New York
11478.50	USB	DyN?
11449.65	USB	DyN

If you look through Gilfer's "Confidential" Frequency List, you will find a number of stations marked "AP New York" -- this is how I found the AP stations originally. The pictures tend mostly to be of people kicking soccer balls, and unknown political figures giving speeches. The last time I checked, though, they weren't on. They used to operate on alternate hours during the evening.

I have an Icom 900a Super Multibander System, which I am trying to modify my 49a (440 Mhz) module for out of band tx/rx... I have removed the diode from the control head (and installed one where told to) and I can now make the display go from 420-470Mhz (approx.) but I cannot transmit out of band (the tx led turns on.) I believe that the module has a very narrow range and a person at icom mentioned retunning the VCO, but would not tell me any more.

Does anyone know how to complete the mod and shift the tx up a couple of MhZ? Has anyone done it?

Lance
p.s. no out of band mod flames please.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

RUDAK-2 MULTI MODE TRANSPONDERS

HR AMSAT NEWS SERVICE BULLETIN 090.01 FROM AMSAT HQ
SILVER SPRING, MD MARCH 31, 1990
TO ALL RADIO AMATEURS BT

RUDAK-2 To Carry Mode B Linear Transponder & Packet Radio

RUDAK-2, the second generation packet radio experiment to RUDAK which was flown on AO-13, has now been completed, tested, and fully integrated into a Soviet geological research satellite, known as GEOS, and is scheduled to fly in July. RUDAK-2 will not only carry a Mode B linear transponder for SSB and CW contacts but will also carry a variety of packet radio experiments. The digital communication capability of RUDAK-2 is astounding: five different data rates from 400 bps to 9600 bps using various modulation schemes. Radio amateurs will have the choice of using four different uplink frequencies for the various data rates. There is also a provision for digital signal processing (DSP) experimentation. Powering this "super-TNC" will be two on-board computers, providing processing at 15 Million Instructions Per Second (MIPS). RUDAK-2 will be compatible with AX.25 protocol and those amateurs who are equipped for FO-20, PACSAT, LUSAT, AO-13 PSK telemetry, and UO-14 will be ready to use RUDAK-2. The following are the transponder specifications provided by AMSAT-DL:

Amateur Radio Payload: Linear and Regenerative Transponders

Linear Transponder Uplink: 435.030 - 435.120 MHz (90 KHz)
Linear Transponder Downlink: 145.880 - 145.970 MHz (inverted)
Output Power: 12 watts HF maximum.
Beacon : 145.880 MHz, CW telemetry.

RUDAK-II: Two onboard computers with IPS operating systems for packet radio (AX.25) (Mailbox, telecommunications experiment with Digital Signal Processing up to nearly 20 KHz, etc.) 1 MByte RAM disk. Four separate uplink channels.

Gain of satellite RX and TX antennas: 2.3 dBi each (dipoles)

Input sensitivity: < -125 dBm (435 MHz) for a C/No of 45 dBHz

SAT-RX-1: 435.016 MHz +-10 KHz 1200 bps, FSK, NRZIC/Biphase-M (JAS, PACSAT)
SAT-RX-2: 435.155 MHz +-10 KHz (AFC) 2400 bps, BPSK, Biphase-S
SAT-RX-3a: 435.193 MHz +-10 KHz (AFC) 4800 bps, RSM, NRZIC/Biphase-M
SAT-RX-3b: 435.193 MHz +-10 KHz (AFC) 9600 bps, RSM, NRZI (NRZ-S) + Scrambler
SAT-RX-4: 435.041 MHz +-10 KHz (digital AFC) RX for RTX-DSP experiments

The downlink can be switched to the following operating modes:
Transmit frequency: 145.983 MHz

Mode 1: 1200 bps, BPSK, NRZI (NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (AMSAT mode for OSCAR-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S (planned for OSCAR-13)
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) + Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)
Mode 7: FSK (F1 or F2B), e.g. RTTY, SSTV, FAX, etc (only for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (e.g. speech)

Power consumption: 14V @ 350 mA (max) = 4.9 W;
Standby: 80 mA (RUDAK without power amplifier)

RUDAK-2 is a joint project of AMSAT-U-ORBITA, the Adventure Clubs in Moscow and the AMSAT-DL/RUDAK Group in Marburg, Munich and Hannover.

[ANS would like to thank DB2OS and DJ0HC/KE6MN for providing this information about RUDAK-2]

N4HY Using DSP Techniques To Receive Mode S Packets From DOVE

This week AMSAT Ground Command Station N4HY accquired a Mode S receive only down converter in order to facilitate his efforts in uploading software to DOVE-OSCAR-17. However, due to a low index of modulation on the DOVE S Band transmitter, Bob has had to resort to using Digital Signal Processing (DSP) techniques in order to copy the packets transmitted on 2401.220 MHz. Another factor which has caused him to turn to DSP to upload software is the very high doppler shift present during Mode S passes for low-earth-orbiting (LEO) satellites. On a recent DO-17 pass that WD0E and WD0HHU monitored in the Denver, CO area, it was noted that there was about a 100 KHz shift in frequency from the beginning to the end of the pass at 2401 MHz! With a down converter and a 45 element loop yagi antenna obtained from Down East Microwave, Bob will have to be able to have sufficient signal-to-noise ratio (SNR) to succesfully complete the DOVE software upload process. Stay tuned to AMSAT HF/VHF Nets for further information on the return of DO-17 telemetry to 145.825 MHz.

N6DBF TO COORDINATE DIAL-UP BBSS

HR AMSAT NEWS SERVICE BULLETIN 090.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 31, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Vice President for Operations, Courtney Duncan, N5BF, announces the appointment of John Wisniowski, N6DBF, Operational Coordinator for Dial-Up Bulletin Board System Activities. In this position, John will be formalizing and expanding the now loosely connected system of dial-up BBSs that carry AMSAT information on a regular basis into the "AMSAT BBS Network."

Systems belonging to the AMSAT BBS Network will be listed as official sources of AMSAT information (AMSAT News Service Bulletins, Orbital Elements, and related releases) in AMSAT publications and will coordinate with N6DBF to set up mechanisms for regular access to the information. Dial-up BBS operators who are now performing this sort of service or would like to be included in the AMSAT BBS Network are asked to contact:

John Wisniowski, N6DBF
1706 Roanoke St.
Placentia, California   92670

or leave a note for JOHN WISNIOWSKI on the DRIG/AMSAT BBS at 214-394-7438.

STS-35 MISSION APPROACHING LAUNCH

HR AMSAT NEWS SERVICE BULLETIN 090.04 FROM AMSAT HQ
SILVER SPRING, MD MARCH 31, 1990
TO ALL RADIO AMATEURS BT

SAREX activities by WA4SIR to be the longest in Shuttle Program

Long standing AMSAT member Ron Parise, WA4SIR, is a Mission Specialist on the Space Shuttle mission STS-35 scheduled to be launched May 9, 1990 from Cape Canaveral. Ron will be carrying a fair amount of amateur radio equipment on this mission and there will be upwards of 120 hours for amateur operation during the 10 day mission.

Ron will operate both 2 meter FM voice as well as 2 meter AFSK packet. The packet station (an HK-21 "pocket-packet TNC" marketed by Heathkit) will transmit bulletins providing updates on the mission and will operate in a ROBOT mode where stations on the ground can connect to the shuttle TNC and obtain a QSO number to validate the contact. The ROBOT should be available for about 90 hours during the flight.

Ron is scheduled to operate the 2 meter voice station during his off hours (for a total of about 30 hours) and he will spend a fair amount of time talking with school classrooms around the world offering them the opportunity to talk directly with an astronaut abord the Space Shuttle. NASA has authorized SAREX in order to "encourage youth to become excited about science and technology" and to publicize manned spaceflight to the general public.

This past week the amateur equipment to be used on the mission underwent EMI/EMC (Electro-Magnetic Interference/Electro-Magnetic Compatibility) tests. These tests are designed to determine the possibility of any interference the amateur equipment my inflict on any of the shuttle electronic systems. NASA has notified AMSAT that all the equipment passed the tests.

With SAREX on STS-35, Amateur Radio may have an opportunity to further the quest for international cooperation in space. Now that amateur radio activity on the MIR space station appears to have resumed, AMSAT is investigating whether there will be a mutual-visibility window between STS-35 and Mir for a first-ever Shuttle to Mir linkup. Adding to the excitement, the STS-35 Mission Commander is Vance Brand, who participated in the the Apollo/Soyuz program many years ago. Amateur Radio may get front page coverage if this history setting QSO is possible. As further details become available, they will be reported in the AMSAT News Service.

NEW TRACKING PROGRAM AVAILABLE

HR AMSAT NEWS SERVICE BULLETIN 090.05 FROM AMSAT HQ
SILVER SPRING, MD MARCH 31, 1990
TO ALL RADIO AMATEURS BT

SATSCAN-II Now Available in North America

AMSAT-UK has announced the release of their latest satellite tracking program in North America. SATSCAN-II is written for PC compatible computers (XT or AT) and is now available to North American amateurs through Project OSCAR. SATSCAN-II was written by Trevor Stockill (G4GPQ) and is an update of the popular SAT-SCAN program used by many AMSAT-UK members. While in the graphics mode of operation, SATSCAN-II incorporates a graphics display of the world, in full color on an EGA screen. The world map includes a footprint of the coverage area provided by a particular satellite. A math co-processor will improve calculation speed of SAT-SCAN-II but it is not required for operation. CGA equipped PC's can use SATSCAN-II for output in non-graphical format.

SATSCAN-II is fully menu driven for easy operation. It also gives the user complete azimuth and elevation tracking information including squint angle data. Tracking information can be sent to a printer or to a disk file for easy transmission by packet radio, or reproduction in club newsletters.

SATSCAN-II also provides the option to determine mutual visibility windows for up to four stations at once, including mutual squint angle data. Therefore, users will know when the best operation times will occur during their schedules.

Keplerian Elements can be imported into SATSCAN-II as a text file in one of three formats:

1 - typical AMSAT-NA multi-line format
2 - two line NASA element format
3 - DCE format as transmitted by UoSAT-OSCAR-11

In addition, Keplerian data may be entered by hand.

SATSCAN-II was originally obtained direct from AMSAT-UK, but is now available in North America from Project OSCAR. All funds received from the SATSCAN-II are directed to future Amateur Radio satellites. For additional information, contact Project OSCAR and include a Self-Addressed, Stamped Envelope.

Project OSCAR, Inc.
Post Office Box 1136
Los Altos, California 94023-1136

AMSAT-NA Planning To Be Present At Dayton Hamvention '90

AMSAT-NA Vice President of Field Operations, Jack Crabtree (AA0P) invites all radio amateurs to join AMSAT this year at the Dayton Hamvention on April 27-29, 1990. As has been the tradition for many years, AMSAT will have a booth and will be sponsoring Symposiums on Friday and Saturday. On Friday, the Symposium will focus on the Shuttle Amateur Radio Experiment-2 (SAREX-2) mission with speakers Roy Neal (N6DUE) and Bill Tynan (W3XO). They will be discussing the upcoming STS-35 mission with Ron Parise (WA4SIR) who will operate both 2M voice and packet radio. On Saturday, AMSAT-NA President and General Manager Doug Loughmiller (KO5I) will be the speaker for a Symposium titled "1990: The Year of The Amateur Radio Satellite." This discussion will give a complete run down of all the amateur satellites launched so far this year and what is being planned for the future. Also, Bob McGwier (N4HY) and Jan King (W3GEY) will give a summary of the MICROSAT program. Before and after these Symposiums, all radio amateurs are invited to come by the AMSAT booth to "talk to the experts." Many of the AMSAT-NA Officers and Board of Directors will be present throughout the Dayton Hamvention. Stay tuned next week to the AMSAT News Service (ANS) bulletins for further details about the AMSAT activities planned for the Dayton Hamvention.

W5UN'S EME ARRAY DESTROYED

HR AMSAT NEWS SERVICE BULLETIN 097.02 FROM AMSAT HQ
SILVER SPRING, MD APRIL 7, 1990
TO ALL RADIO AMATEURS BT

Tornado Destroys W5UN's Huge EME Array

AMSAT-NA officials learned this week of the destruction of Dave Blanschke's (W5UN) world famous Earth-Moon-Earth (EME) moonbounce array due to a tornado that touched down at his QTH located near Houston, TX. Many will remember the January '89 QST article spotlighting Dave's EME system and the enormous effort he put into building the world's largest privately owned 2M EME array. Most recently, OSCAR users heard that W5UN assisted AMSAT when it needed all of the 32.5 dBi gain generating about 2 Megawatts EIRP from his moonbounce station to reset the On-Board Computer (OBC) of DOVE-OSCAR-17 (DO-17) three weeks ago. (Due to a software crash, DOVE'S 2M transmitter was overloading the command receiver.) The signal from W5UN's EME station was able to silence DOVE's 2M transmitter. After several tries, W5UN was able to send the reset command allowing N4HY and NK6K to regain control of DOVE and it's battery maintenance system. In all respects, W5UN's EME installation was an exemplary amateur radio station becuse of its ingenious design. W5UN suffered the nightmare that every amateur fears: Total destruction of an antenna system and the years of effort spent building an excellent station. AMSAT-NA would like to express its deepest regrets for W5UN's loss along with its greatest appreciation for his help during the critical period when the DO-17 OBC needed to be reset.

As a final note, W5UN will still be keeping EME schedules using the station of N5BLZ.

High speed satellite data communication record set.

```
cmd:C G0K8KA v UOSAT3-1
cmd:*** CONNECTED to G0K8KA VIA UOSAT3-1 [04-Apr-90  22:12:03]

Hi Jeff - a world first??? >>>>
```

```
  What say
Yes - a bit pedestrian, but what do you expect for a first cut...
  Yes, but my tnc doesn't seem too happy with it!
Hmmm - shall I send you the file???  >>>>
  I gotta check some asynchronous tlm, so will have to suspend the
  pce for a bit.  Sorry ....
  Yes, try to send it. now>>                     (* Phew! *)
OK will send.                                    (* So I did *)
```

This is the first transaction to be digipeated through Oscar-14 at 9600 baud between James Miller, G3RUH and Jeff Ward, G0K8KA. The date and time are 1990 Apr 04 at 2215 UTC, orbit number 1041. This is believed to be the fastest data transmission through an amateur satellite to date.

UoSat-D is on 9600 baud for about 1.5 minutes every 5 minutes, sometimes longer. This signal sounds very like an unsquelched background hiss. However the squelch will be triggered as normal. To determine if UO-14 is in 9600 baud mode look for d:1 in the LSTAT telemetry frame. This means the high speed digi is ON. d:0 means it is OFF. This is the same convention as in the Microsats because the same software is in use for these tests. The downlink frequency was 435.070 Mz, +/- 10 kHz doppler shift. As FM was used, only occasional manual adjustments were needed to the receiver. The uplink frequency used was 145.975 MHz.

Equipment at both ends was FT736R with TX audio direct connected to the varactor, and RX audio directly connected from the discriminator. James reports that the two non-destructive additions to the FT736R took about 30 minutes to implement. Using similar techniques, many of today's commercial transceivers can be modified to allow for similar high speed data communication. A 9600 baud full duplex modem is required to drive the tranceiver and a number of designs are commercially available at present. A comprehensive article describing the G3RUH design is published in the ARRL 7th Computer Networking Conference Papers, Oct 1988, pages 135-140. It can be obtained from ARRL, RSGB and other Society bookshops.

> [AMSAT wishes to thank G3RUH for the information for this bulletin and also congratulates James and Jeff for their record setting accomplishment].

Satellite Keplerian Elements to be Broken into Additional Groups

AMSAT's Orbital Data Manager Dick Campbell, N3FKV, announced that this week's release of current orbital elements will be split into more categories. The bulletin ORBS-xxx.O (OSCAR) will contain AO-10, UO-11, RS-10/11, AO-13 and FO-20. These are the satellites with wide band transponders used predominantly for CW, SSB and RTTY communications. The bulletin ORBS-xxx.D (MICROS) will contain UO-14, AO-16, DO-17, WO-18, and LO-19. These satellites are "digital" in nature, using packet communication as the primary modulation technique. The bulletins ORBS-xxx.M (for Manned and Miscellaneous) and ORBS-xxx.W (for weather satellites) will continue to be published in their present format.

Dick indicated that this move is taken to further relieve congestion on packet circuits and allow shorter downloads for users who are interested in only one class of satellites.

Japan AMSAT Organization (JAMSAT) Elects New Board of Directors & Officers

At the 1990 Annual Meeting of Japan AMSAT Association (JAMSAT) that was held on March 18, 1990 in Tokyo the following Board of Directors (BOD) were elected and will serve until 1992:

* JK1VXJ Moriyoshi Ohara
# JM1MCF Yuutai Katou
* JQ1HXT Shinichi Sudo
# JR1FIG Masaya Fukasawa
# JR1ING Youichi Kikukawa
# JR1SWB Mikiyasu Nakayama
# JA2PKI Takeo Okamoto
* JG3XOD Toshihiro Sugimoto
# JH3BJN Sumio Nakane
# JM3MAJ Hiroyuki Oohata
# JA6XKQ Yoshiyuki Takeyasu

Elected Board of Directors
* Nominated by elected Board of Directors

Officers for the 1990-1992 period are:

President - JA2PKI, Takeo Okamoto
Vice President - JR1SWB, Mikiyasu Nakayama
Vice President - JH3BJN, Sumio Nakane
Auditor - JH1CMP, Morizo Iseki

The Board of Directors has established the following goals that they will be working to achieve during the next two years:

1. Transfer of most clerical tasks from volunteer team to a professional organization.

2. Resumption of a membership recruitment campaign.

3. Participation in future OSCAR projects.

4. Improvement of satellite users support.

[ANS would like to thank JA3PKI for providing this information.]

SB ALL @ AMSAT $ANS-097.07
AO-13 OPERATING SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 097.07 FROM AMSAT HQ
SILVER SPRING, MD APRIL 7, 1990
TO ALL RADIO AMATEURS BT

AO-13 Transponder Schedule to 07May90

Mode-B : MA 000 to MA 165
Mode-JL : MA 165 to MA 195
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 256
Omnis   : MA 240 to MA 060

BLON = 207.8 and BLAT = 0.6   for 16Apr90

The Mode-B beacon will be ON from MA 195 to MA 200. Only the Mode-S transponder & the Mode-B beacon will be ON from MA 195 to MA 200. Beginning 07May90 there will be a transponder and attitude change on AO-13. During magnetorquing to BLON/BLAT 180/0 the transponders will be switched off from MA200 to MA060. After 09May90 a new schedule will be announced.

AO-10 is currently experiencing poor solar panel illumination angles and until further notice its transponder is not available for use. It is expected that this will continue for at least another 4 to 6 weeks.

What blithering lunacy!! Ham radios don't kill children playing in their
schoolyard!!! If you don't see any difference between guns that kill and
radios that don't, then you yourself are part of the proof that guns MUST
be banned as soon as possible.

SHUTTLE AUDIO REBROADCAST

HR AMSAT NEWS SERVICE BULLETIN 098.01 FROM AMSAT HQ
SILVER SPRING, MD APRIL 8, 1990
TO ALL RADIO AMATEURS BT

WA3NAN TO RE-BROADCAST HUBBLE TELESCOPE DEPLOYEMENT STARTING 4/10/90

On Tuesday, April 10, 1990 at 8:47 Eastern Daylight Time (EDT) the Shuttle Discovery will lift off carrying the most complicated un-manned spacecraft ever launched. The Hubble Space Telescope will lofted to an orbital altitude of 400 statute miles and will be deployed with a 28.5 degree orbital inclination. Radio amateurs will have an opportunity to hear all the excitement "live" from NASA thanks to the hams at the Goddard Amateur Radio Club (GSFC ARC) and the other NASA affiliated radio clubs, eg., W5RRR at JSC, W6VIO at JPL. The following frequencies will be used to re-broadcast the live audio during the six day mission:

3860   KHz
7185   KHz
14.295 MHz
21.395 MHz
28.650 MHz.

The Shuttle audio re-broadcast will start about ONE HOUR BEFORE LAUNCH and will only be in operation when the astronauts are awake. The astronauts work day will commence at around 3:00 A.M. EDT and they will turn in around 7:00 P.M. EDT. The Hubble Telescope will be deployed at 7:30 A.M EDT on Wednesday April 11, 1990. Amateurs and space enthusiasts might particularly want to listen during that time because it will be a period filled with a lot of activity. For those who wish to track the Shuttle for the purposes of visual contacts, Frank Bauer (KA3HDO), President of the Goddard Space Flight Center Amateur Radio Club (WA3NAN) says that every hour the orbital elements will be read by the GSFC club members who will be operating the station. AMSAT encourages all radio amateurs to listen to the live audio from the Shuttle during this history making flight.

[For those who would like to download more information about this Shuttle Mission, all are invited to check into the NASA sponored SPACELINK BBS at (205) 895-0028. The phone number of the GSFC ARC hamshack is (301) 286-6673]

Can anyone help me find some info on SSTV for the Commodore 64. I have the Edwin Cox software from Viccomm from a few years back, and I have the article from Ham Radio Magazine, also a few years back. But I understand there has been some commercial software available which included formats other than the 8.5 second black and white. Also neither of the two programs I have now is totally satisfactory. The Expanded Vic-20 program which Cox did was'nt too bad, but the C-64 program was terribly lacking. Also neither of the programs I have now can toggle between receive and transmit, another drawback.
Any help would be appreciated. Please E-Mail.

I spotted this whilst reading through the November 1985 RSGB Mag "Radio Communication"

Printed in Technical Topics, provided by G.H.Lucas G3TWE.

"Fill a small container with methylated spirits(a bottle cap is ideal) and light it. Place the end one inch or so in the flame to burn off the insulation., remove it and blow the burning insulation out. Next replace the wire in the flame and heat until the wire is red hot, then quench the wire rapidly by immersing it in the unburnt spirits, and remove quickly. The result is clean multi-strands of wire that may be twisted together, tinned and soldered in the conventional manner."

The term "Litz" was derived from the German Litzendraht (Litz - strand, draht - wire) and is correctly applied to conductors which are built up by successive stranding of wires or groups of wires in groups of three, each individual wire being insulated with enamel or silk, although often applied also to what are more correctly termed 'textile-covered bunched enamelled-copper wire conductors'. Litz wires were developed for use in which skin effect becomes significant."

There is a little more but that should be enough on the subject.
Please note I am not the expert - just repeating what was printed.

Regards,
Richard

CEO summary:

This system has been in operation for a couple of years here in Mass. One of my friends had it installed in his car. The way it works is that *you must first report your car stolen*. The police then enter the registration number into their stolen car computer system & the Lo-Jack people are linked into this system. They check to see if the VIN matches any of the ones they've installed transmitters in. If so, they start trying to activate the "transponder" in your car. There's a nationally allocated frequency for this (173.075 I think, I have it at home). If you listen to this frequency, you can hear something that sounds like packet...that's their activation signal.

My friend was listening to his scanner one night and heard the local cops chasing a beaconing Lo-Jack equipped car. They found it and the thieves abandoned it and got away. The cops saw the thieves leaving the car!

Several drawbacks: (1) Nothing happens until you notice your car's gone. (2) Smart crooks leave the cars to cool off for a day or two before picking them up again. (3) You need a cop who knows how to DF.

I did not see the episode in question as it aired, but caught it on my

VCR. I watched it, then rewound it and checked the pattern he was sending.

He was sending on an MFJ-557 (like I use in my code classes!) and he definitely sent a W6 callsign. I could not tell the last two letters because they were run together. The last two letters were either SC or VR... I forget the first letter of the call I wrote down. When I looked in the callbook there was only one of the two calls listed.

The hand that was sending, I would say, definitely knew what it was doing.

Interesting.

In INFO-HAMS V90 #371,
zaphod.mps.ohio-state.edu!usc!pollux.usc.edu!kjh@tut.cis.ohio-state.edu
(Kenneth J. Hendrickson), says;

<...Somebody asked about the Maidenhead Grid Square Locater System. Here are the details of how this system works. This system is in widespread use in North America on VHF/UHF/SHF/EHF. I believe that it is also catching on in Europe...>

Har, har, har!!!

Kenneth, it was *invented* in Europe. We have had a European wide locator system for some years. It was called the "QRA locator" system. It suffered from a number of shortcomings, in that it couldn't be extended world-wide, and it was difficult to calculate distances between stations using it. The Maidenhead system was design to supplant the QRA system, whilst providing some upwards compatibility - the Maidenhead squares correspond with the old

QRA squares directly.

<...On higher
bands, (or maybe for other reasons), you might want to identify your
location more accurately...>

Like VHF contests using radial-ring scoring.

73,

Hugh Davies, G0CNR.
(IO91US. 71 squares in 16 countries on 144MHz)

But ham radio operators are facing organized forces which are probably more powerful than the anti-gun forces. These are the commerical groups that covet our frequencies. They are better financed and work quietly in the background (underground,under-table ??) and usually by the time we find out what is going on it is too late to do much about it.

I also feel that you took the comments made by Neal wrong. My reading of his comments were about the way that media handled the subject (radio) as opposed to the way they handle the subject of guns. On last nights Connie Chung program they covered the subject of guns in movies. Included in this discussion were quotes such as ".. if guns were once props in moves, they now enjoy star status themselves" and ".. box office power often comes out of the barrel of a gun." by Paula Zahn, Connies replacement this week. Could you imagine it if things were turned around and movies started showing ham radios being used by criminals and the media picked this and started publishing articles about how a small number of "hobbieists" are tying up "Millions" of dollars worth of commerical frequencies.

And also in reply to your comments about "blithering lunacy", guns don't kill children playing in schoolyards it is usually lunatics that are imitating what they see in the movies or on tv.

I think that any further discussions along these lines should be moved to talk.politics.guns.

Has anyone petitioned NASA to have the first Amateur repeater on Space Station Freedom? I'd love to have my call broadcast for all those extra-terrestrials to hear :-). Seriously, it'd be a great PR thing, and pretty nifty to show school kids, as well as being useful to us Amateur types. You could have all sorts of nifty packet stuff, experimental beacons, ATV, FM voice, etc. Imagine an all-mode radio station a la w1aw floating around up there. I'm sure NASA wouldn't mind an extra EVA or two to put up new antennas or adjust the linears :-) (Hehhhhhhllo.) It could even be attached to the outside of the station via a large mag-mount, so that it could be moved for station expansion or easy repair. Please post or E-mail you comments.

I am currently working on putting together a transmitter and receiver for the brand-new 18Mc band; the transmitter is the 6W VXO-Controlled Transmitter in the 19XX Radio Amateur's Handbook (an invaluable reference which I didn't see on your list). The receiver will be a cobbled-together design based on the NE-602 RF-amp/mixer/oscillator chip. If you're interested (and if I make it work...) I can send you the design.

> I would also like to hear recommendations about books, magazines, etc.

Someone else has started a thread on the topic of mail order houses on sci.electronics/rec.ham-radio, so perhaps they will have a more complete list. Here are the places I use:

(New parts)
Digikey
P.O.Box 677
Thief River Falls, MN 56701-9988
1-800-DIGI-KEY
No minimum, $3 shipping for under $25, discounts for over $100, weak on radio specific parts.

Circuit Specialists
P.O. Box 3047
Scottsdale AZ 85271-3047
1-800-528-1417
Minimum $15 (except none for check or money order), $3 shipping, fairly good selection of radio parts.

Amidon Associates
12033 Otsego Street
North Hollywood CA 91607
All those damned, mysterious T37-6 cores specified in construction articles which semi-baffle us "old farts" (even us young OFs) who want to see uH and n linear inches of m-inch coils?[1] Amidon (and others) makes them. Prices from Amidon are a little higher than what one can find elsewhere, but they ship VERY fast -- I've gotten orders back in a week, and that's very nice.

Mouser Electronics	Mouser Electronics	Mouser Electronics
1433 Woodside Avenue	2401 Highway 287 North	12 Emery Avenue
Santee CA 92071	Mansfield TX 76063	Randolph NJ 07869
-->	1-800-34-MOUSER	<--

$20 minimum (add $5 if under); shipping charges according to shipping method ("check or money order: add 10% -- credit or refund will be issued for any over-amount"); wide selection. They also ship quickly, but I've found them to be prone to discovering the need to back-order something between the phone call and the shipment...

Jameco Electronics
1355 Shoreway Road
Belmont CA 94002
(415) 592-8097
$25 minimum; shipping charges vary. Mostly they sell computer parts; they still carry a number of analog ICs and the usual resistors, capacitors, etc. Maybe if enough people try to buy analog stuff from them they'll abandon this digital fad and get back to real electronics. ;-) I've heard some people complain about their service, but I've had reasonably good luck (they goofed one order a bit, but sent the correct item promptly).

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
1-800-543-4330
$20 minimum ($25 charge); shipping varies, plus at least $2 handling. They cater mostly to repair technicians, so they don't have a lot of stuff you might expect to find, but they do have a lot of stuff you might not find anywhere else. Their salespeople have also been extremely helpful and friendly.

Crystek Corporation
2351/2371 Crystal Drive
P.O.Box 06135
Fort Myers, Florida 33906-9963
1-800-237-3061
$10 minimum for charges, shipping varies (and isn't heinous). They seem to be the least expensive crystal manufacturer. Crystals are like $6-$9 depending on frequency, form factor, and tolerance.[2]

JAN Crystals
2341 Crystal Drive
P.O.Box 06017
Fort Myers, Florida 33906-6017
1-800-JAN-XTAL
Almost identical to Crystek (including the address). Just a tad more expensive. The catalog I have shows more pre-made crystals for various commercial rigs (including some 2-meter transceivers), plus they have a "special" on amateur crystals in FT-243 holders (which actually is the same price as their regular cases for similar tolerance); Crystek didn't seem to have FT-243 holders available (but I don't have their full catalog, and won't for a while, since they said they've run out for now...).

Radiokit
[alas, I can't find their catalog.]
Pelham NH
Radiokit has a number of kits (gee!), and some selection of parts, including a wide variety of VARIABLE CAPACITORS (which I've found to be as rare as hen's teeth. Now I know that good ones are as expensive, too...).

(Favorite surplus outfits)
Marlin P. Jones & Assoc.
P. O. Box 12685
Lake Park FL 33403-0685
(407)846-8236
No minimum (add $1 under $10), shipping like $2 plus UPS. Lots of electronics stuff, random other things (pressure gages, lenses, freon tank conversion kit, motors, etc.).

All Electronics Corp.
P. O. Box 567
Van Nuys CA 90408
1-800-826-5432
$10 minimum, $3.50 S&H. They lie; magnets aren't electronics. Other than that, they're a great place to deal with.

R&D Electronics
1224 Prospect Ave.
Cleveland OH 44115
1-800-642-1123 (tuesday through saturday)
$10 minimum (unless you're a school with a purchase order, in which case it's $25), S&H per UPS. Lots of motors, also a lot of electronics stuff. Seems like a more random collection than MPJ and All-Elect. above.

Hosfelt Electronics
2700 Sunset Boulevard
Steubenville OH 43952
1-800-524-6464
No minimum; $3.75 S&H under $101, $4.75 under $251, free above that. I think they're surplus; their catalog has that "random grab-bag" look, but they have a very well-stocked grab bag.

Surplus Sales of Nebraska
1315 Jones Street
Omaha Nebraska 68102
(402)346-4750
No minimum; at the moment, no catalog, for they are still preparing their next catalog, and have run out of their previous, so all I have is "Supplement 5A" from which I've used the order form... They say they have a wide selection of hard to find parts, and the index I have lists air-variable capacitors (which I've found hard to find) and B&W coil stock (oh boy! see [1] ;-). They also have bus seats available (get 'em while they're hot![3]).

Well, that's it for the sheaf of catalogs I grabbed. If I missed any really good ones, I'll post another article (or if someone announces that they are collecting this kind of info, I'll mail it to them).

Very 73, John Woods   WB7EEL

[1] When I was starting out in ham radio, I was sort of puzzled by toroids, since I didn't know where to get them, and it also seemed kind of annoying to have to stock a zillion different types in order to be able to cobble up random projects. Now, at least, I know where to get them, and have stocked

a dozen or so different types -- that still seems annoying, but less so once I sat down and tallied which types were used in, say, the 1988 Handbook...

[2] Crystals were another thing that I found intimidating when starting out. Don't worry, the folks at Crystek were certainly friendly, and I'm sure JAN is just as nice. Crystals are a bit expensive if you need more than a few, so don't plan on covering all of 10m with crystals spaced 1Kc apart...

[3] They bought a school bus for travelling to hamfests, and didn't need all the seats. So, with a big grin, they put the spare seats into the catalog.

I cannot let Mr. Grubs blithering lunacy go here. Banning guns will not (and has not) solved ANYTHING. It has (witness Washington D. C. , murder capitol of the U. S., where guns ARE banned. There was a specific purpose for including the 2nd amendment in the Bill of Rights (the right to keep and bear arms), and that prupose is even more valid today than ever. (hint: it's not for "sporting purposes")

Agreed, Patrick Purdy deserves the maximum punishment, and his name is pornography in our household, but banning guns is NOT the answer.

BTW, there ARE organized groups dedicated to banning ham radio. Witness the zoning restrictions in Colorado and "Deed restrictions" recently discussed here.

Followups to talk.politics.guns please.

Sure they can, drop a heavy rig out the window on their heads, wire up the B+ voltages to their hearts, or strangle them with antenna wire. I don't think there is anything in the world that couldn't be misused to kill someone given inclination.

Hello,

I recently purchased a Uniden HR2600 mobile 10 meter
rig and am very happy with it. I've heard that it
is not to hard to boost it's power output by replacing
the final transistors and adjusting the ALC.
Does anyone have the particulars of these mod's?
Also, if there is any way of extending the receive range,
I'd be interested in that too.

Thanks in advance,

>And, be fully prepared to pay MORE for a service which costs the telco LESS to
>supply than it does for them to supply voice lines for the modems. ---

C'mon gang, let's quit discussing the alleged merits of this chain letter!

The FCC NEVER proposed a modem tax. They did once upon a time, years ago, discuss a charge scheme that would have classified some services as equivalent to long distance carriers. Some of those services were modem based, some voice. The whole plan was killed, then a stake was put through its heart, then it was cremated and buried under Cthulhu's crypt.

Southwestern Bell, in an entirely different matter (see alt.cosuard, I guess), decided that home dial-up BBSs were "business" users and thus had to pay business line rates; that's being fought. But it too has nothing to do with the way lines are muxed. BTW, the telco can't split one voice channel into 6 9600's on a dial-up basis; they don't know what your modem's doing, and have no right to intercede unless you ask them to! A dial-up call today is a 3.1 kHz audio path. ISDN's a different story; a path will be 64 kbps, OR 3.1 kHz audio, depending on what you ask for.

Hi, I'm studying for my novice and I have a question maybe some of you could answer.

I have a hand-me-down 18-ATV Hy-Gain vertical antenna (10-80 meters)
about 25' long. I'm thinking of mounting it on top of the house
to a vent pipe. There seem to be plenty of vent pipe mouning kits,
but I think they're really designed for a shorter TV antenna.
I'd really like to guy this thing higher than the base but some
of my OF friends say I shouldn't use anything conductive except
on the radials.

I was thinking of using a high test fishing line, but the
people at the fishing stores say this stuff stretches too much
because its monofilament.

I live in a high wind area where 70 knot gusts are not uncommon. I
really don't want that kind of torque on the vent pipe.

So how do you guy those verticals at a point other than the base?
Also, is it OK to use 22 guage wire for the radials?

Thanx,
Jim

.
.
.

Can ANYONE help me??? A friend of mine and I own a Microwave Modules transverter... one is the 432 version, the other is the 144 version.

We bought these at a flea market without any manuals or schematics.

I have been able to get a partial copy of the manual for the 432 version, but it does not seem to match the unit that I have exactly. The manual references a single "input level" pot, and a jumper post pair that can be used to adjust for the input drive level of 1 to 500 mw. My unit has TWO (or appears to) potentiometers that seem to affect the output level and there is no jumper post pair to be found on the board.

The 144 version does seem to have a single pot and the jumper post pair that is mentioned in the manual that I have for the 432 unit...

Does anyone have a manual AND SCHEMATICS for these units???

If so, I would be interested in obtaining a copy of each....

Also... if anyone has one of these units for SALE (for any band)... please let me know, as we may be interested in obtaining more units.

Thank you,

Rich (NM1D)

funny thing about proposal # 4 is, given human nature, it probably would
ENHANCE the lifetime of CW as a widely used mode, for exactly the reason
you state...entertainment value. I enjoy CW, was pretty good at it when I
used it regularly, but have to agree it isn't relevant. Besides, boring
conversations about the rig, the signal report, and so on can take place
in any language and using any mode. Only 1/2 :-) here; this I view as one
of the reasons for the decline of the hobby.

I guess it depends on how badly you want to run mobile; I ran HF mobile from
a Plymouth Horizon for about 2 years...with an IC-730 which isn't exactly a
small radio. I built a wooden stand which sat over the hump in the floorpan
and held the radio up at about a 30 degree angle so I could see and reach
the controls. I still use the stand, but now in a Voyager. Only problem with
HF mobile is that if you have a voice that tends to drive the rig to full

PEP frequently, you can see the lights dim slightly on voice peaks :-(. Doesn't seem to really hurt anything, just runs the radio to its limits.

HF mobile, by the way, is great fun! 20m can be frustrating, but 15m DX right now is almost as good, sometimes even better, and 40m daytime ragchewing isn't too bad if you find the right conversation--it always seems to me that 40 in the daytime is populated by a bunch of old f*rts who've known each other for 40 years, and talk in a sequence of 5 minute monologues with about 1 second for you to get in edgewise.

Good luck with whatever setup you end up using!

If anyone's interested in this Maidenhead system and has a HP28 or HP48 handheld calculator, here are some routines that will workout the Maidenhead location from lat/long and vice-versa. Also routines to calculate great circle distances once you have the locator.

---

QRA Locator Square Translator: The following procedures translate between the worldwide QRA (or ANB or Maidenhead, whatever its called) locator system used by Radio Amateurs.

->QRA   Takes Latitude from stack level 2, and Longitude from level 1 and returns a string with the Locator. South and West are negative. The input should be in DD.MMSS format. The input is tested to ensure that it is +-90 and +-180 respectively. For example, take QTH C->R ->QRA gives "IO85HX" for my locator.

QRA->   Takes a string from the stack level 1 and returns the Latitude in level 2 and Longitude in level 1 of the square center. This is the inverse of ->QRA. The output is in DD.MMSS. Some error trapping is done on the input, but it is not foolproof.

Great Circle Distance & Bearings: Calculates the distance between your station and the remote station, also gives beam heading required.

GCIR   Takes the output of QRA-> (Lat and Long) and uses the Lat and Long in QTH to compute the great circle distance and bearing from QTH to the stack Lat and Long. The distance is returned in Level 2, in Km. The bearing, in DD.MMSS from north (+E,-W) is returned in Level 1. This program assumes the earth is a perfect sphere (we all know this is an approximation as the earth is actually flat :-). This program uses the PRESERVE routine given in the manual to ensure degrees mode is used.

QTH   Must contain the complex number (Lat,Long) representing your stations position.

ERAD   Must contain the equatorial radius of the earth. I use:
6378.888
which is in Kilometers, thus the answer to GCIR is in Km, you can use UNITS to change this constant if you wish.

Radio Horizon: Calculates the flat-band line of sight communication distance at VHF.

HORIZ   Returns the distance between a point on the earth and the VHF radio 'horizon' given the height above sea level. The height is taken from level 1, and the distance returned in level 1, both will be in the same units as ERAD. e.g. For 914m ASL enter 0.914 to give an answer of 124.68 Km. Note this is NOT the same as the line of sight horizon, as it includes a correction of SQR(4/3) to allow for tropospheric bending.

The Procedures:

->QRA   Checksum BC9E

```
        << HMS-> 180 + SWAP HMS-> 90 + -> lo la
           << IF lo 0 < lo 360 > la 0 < la 180 > OR OR OR

Hams report good results using plastic "Weed Eater" (tm) string for
supporting wire antennas, including 1750m transmitting antennas which
are somewhat like Tesla coils and very sensitive to insulator leakage.

The stuff is very strong, and relatively inexpensive.  I don't know
about long-term stretch.  The colored varieties are probably more
resistant to sunlight deterioration.

Hope and pray that the line is not busy. If it is, that "wonderful"
answering machine will tell you using an automated voice. The real
catch is that YOU STILL PAY FOR THE LONG DISTANCE CALL just to find
out you can't talk to anyone.

This is why I currently refuse to consider purchasing any Kenwood product.

I am attempting to program a Weather Fax (WEFAX) interface for the Amiga computer, but don't know what the standard aspect ratios are. If someone out there knows what the standard height/width ratios are, and how many pixels across a standard line are normal, please reply to this message via E-mail.

What if they hear enough to identify who you are?

> Perhaps so, but the hams will be within the law, since the wireless
> speakers must accept any inteference. Just politely tell the owner of
> the wireless speakers than he should take a hike.

The ignorant member of the public is not going to notice that you are polite; he is only going to notice that you are refusing to stop with the interference (assuming he has identified you).

> Lawsuits of what kind? Civil suits on what grounds? Criminal charges....

> no way....you are within the letter of the law. Anyone foolish enough to
> file a civil suit will lose, and then you can counter sue for false and
> malicious lawsuits.

Unfortunately, you often have to front quite a large sum of money to defend
yourself even in a frivolous lawsuit that you could collect fees and costs
from when you win.

> OK, then don't broadcast to the owner of the speakers, just keep on
> boradcasting your normal stuff......he is still going to experience
> interference that will render his music unenjoyable!

If you know the interference is taking place, you better be prepared to
defend against the guys lawyer citing "INTENTIONAL interference" and saying
that since you knew the interference was taking place, despite the fact
you have a license, you have so many frequencies you could have chosen
a different one, and yet you chose to continue the interference.

(I'm playing devil's advocate here, just be prepared)

I have a poster on the wall listing ALL the allocations (neat colors too!) for Canada published by the DOC. It shows the same allocations as you document here. However, on looking at the TRC (rules) I note that there are no amateur specifications above 24 GHz. I called a friend at the local DOC to enquire about the discrepancy and was told that since no-one had asked, there was no formal allocation. I suspect the wall chart was drawn to illustrate the ITU allocations for the region. The basic stance of the local office has been "a request for a formal interpretation means work for us, and as we are short staffed, you might not get what you think you deserve". The unspoken meaning is "do it, but if we get any complaints, we might have to make a ruling".

This was brought home after I asked for a clarification of the rules for 902-928... it seems that since I am NOT an advanced amateur, I can NOT use CW on this band, A3 and F3 only!!! So far no-one has complained about my (albeit sloppy) code on this band!

So that little anecdote aside, there is a small group (10 or so) in the {Hamilton, Toronto, Cambridge, London} Ontario area on 10 GHz FM and I am working on integrating a 200 mw SSB Electronics transverter into a rice-box all-mode mobile rig for the contest in August/September.
(Still looking for a SMA to waveguide transition too.)

Also wrt 300000 GHz and up, VE3LPP is interested in HeNe laser operations (best DX is 2Km at the moment). Great for the quick-and-dirty set up on a LOS path for the "lower" bands. (I know, I know... watch the eyes!)

Regards, Stu Beal, VE3MWM, (U009@CCIW.BITNET),
National Water Research Institute,
Burlington, Ontario, Canada.

The future lies ahead. And behind us lies, lies... lies.

repies:

What blithering lunacy!! Ham radios don't kill children playing in their schoolyard!!! If you don't see any difference between guns that kill and radios that don't, then you yourself are part of the proof that guns MUST be banned as soon as possible.

I say:

I personally just wanted to say how much I enjoy seeing such a logical and level headed response from Mr. Grubs. I had in the past believed that he tended to go off half-cocked and misread what people were trying to say with the result being a massive flame battle starting on this net over matters not related in any way to ham radio. In short, that he just liked to participate in hateful arguments.

It is nice to see that I was so totally wrong in my beliefs and that he can offer such a thoughtful and calm response to another persons point of view. I am sure all of you who read the above will agree. So let me say in public how sorry I am to have felt this way and hopefully when I meet this gent on the air I can tell him so ..... personally.

p.s. It will be hard to talk though... this tongue keeps pushing my cheek
     so hard.... maybe we can have a CW QSO.

Uhhhhh.....The "Absolute Sound"?? Are you SURE? These are the guys who
publish stuff about "skin effect" (at audio frequencies!) in speaker
cable and other weirdness. Anyone looking for a laugh should check out
Enid Lumley's monthly column. Recently this column claimed that folks
who want "real" high fidelity should pay attention to the routing of
power cords to the stereo system. I swear, I thought they were talking
about microwave waveguides....warnings that sharp bends in the power
cord could cause audio distortion! This magazine even suggested that
the power cord be delicately suspended so that it didn't come in contact
with any hard surfaces!

I think their first product was an airplane kit (not a model, a REAL
airplane that you could build in your garage!) in the early 1950s.
After that, I think their first electronic kit was an oscilloscope.

Does anyone remember their first personal computer? When I was a little
kid in Berkeley about 30 years ago the father of a friend of mine had
one. It was an analog computer, and was constructed on a big sloping
console.

Even in a large home, an unmodified cordless phone should work just fine. Since there are many cordless phones that boast "1500 foot range", I doubt if you would need a special antenna just for walking around the house.

I modified one for my office for greater range. Not exactly legal, but it works.

I bought one of those cute little cordless "LiteSet" units made by Plantronics, and sold by DAK. I put the base on top of a metal filing cabinet, and opened up the case....finding a ground connection on the PC board where I connected a lead going to several ground radials. I stretched two across the wall that the base unit and the cabinets are up against, and stetched two more diagonally across the cabinets and taped the extra length down over the corners. Then I took one more wire, and attached it to the same place where the base unit antenna was attached. Because the whip was short, I shorted out some of the turns on the series inductor, since I was now using a full 1/4 wave radiator. I took this wire and ran it vertically up the wall, terminating it on a tack. The radials and the vertical element were each 5 feet long, which is about 1/4 wavelength on the transmit frequency of the base unit.

This is a real handy device to have around the office. I can even
go for a walk out in the woods, and still take customer calls!

>John Kirby

I have not tried a Visitel on the radio but I have serious doubts that it could ever work. The details of the transmission format are a little fuzzy in my brain but here is what I recall.

The image starts with a digital header containing synchronization signals and information about the image size. After this there is NO horizontal sync as in most ham SSTV formats.

The picture is composed of 96 x 96 pixels of 32 gray levels.
The pixel rate and audio carrier frequency are both 3579545/2048 per second. Gray levels are conveyed by a combination of phase and amplitude modulation. 2 phases (180 degrees apart) and 16 amplitudes.

Each pixel is one audio cycle.

This is fine for a phone line or FM radio. Let's perform a thought experiment about what would happen on SSB ...

Suppose your tuning was off by 20 Hz. The receiving end expects one pixel per audio cycle and would gather the pixels at 1727 or 1767 per second while the sender is producing them at 1747 per second.
The phasing would be all messed up. AGC and QSB would also mess up the amplitude modulation of the audio carrier.

Several people have proposed using the Visitel for HF SSTV but I have never heard of any success. I would be very interested in hearing more about people's experiences with it.

If you would like to try SSTV at a low cost use your home computer.

* AEA has an interface for the Amiga for about $300.

* SPEC-COM has SSTV software for the Radio Shack COCO. I think it was about $40.

* A color SSTV program for the Atari ST is available from several user groups. It requires a simple interface that can be built for about $7. See 73, December 89 and January 90.

* I have a vague recollection of a product for the IBM PC from a company named something like Computer Systems Consulting. But it was only black & white. You don't see too many B&W pictures anymore.

In summary,

- The Visitel is not compatible with any of the ham SSTV modes.
- The Visitel modulation scheme can't be decoded by the usual Frequency to Voltage demodulators.
- I seriously doubt the Visitel would work over an SSB radio. (Please, someone - prove that I'm wrong!)

Color SSTV can be very expensive but it doesn't have to be anymore. If you must have 262,144 colors, spend $1295 on a Robot 1200C. If you want to make only a small investment to try something new, use one of the systems based on a home computer.

Yes, I'd like to know if anyone has such a mod.  But please post it to the
net as there is likely to be a good audience for such a mod.

Does anyone have any info on software available to control the
Kenwood TS-440S from an IBM compatible computer?
Would appreciate E-Mail.
Tnx.
Art Rockwood VO1AX

[followups to news.groups. crossposted to s.e r.h-r for technical reasons, r.r.s because of satellite discussions]

After the disaster during the first week, voting has proceeded smoothly, but at a pace which will not result in passage of the new group. The current count is 19% no, 81% yes, with 36 votes received. If you want this group to succeed, please vote for it, if you haven't already. I believe this group will be a useful one, but 99 other people have to agree. Please check the votes list. If your name is not there and you have voted, please vote again. I will filter the dupes.

I've been told that many have sent mail to quack.uop.edu. quack is NOT in the .uop.edu domain. Either use uop.edu!quack!... or ...%quack@uop.edu or some such.

CHARTER: REC.ARTS.TV.CABLE

This group is for discussions pertaining in general to cable television, and satellite television. Broadcast only issues should go to rec.arts.tv. More specifically, discussions of technical, regulatory, programming, and/or customer service/cost/quality issues are welcome.

Technical discussions of cable programming technology are welcome, which is somewhat at odds to its placement in "rec," but this is proposed simply because of the infeasability of placing the group elsewhere. The original name rec.arts.tv.catv was objected to by several because of the confusion over the designation "catv" meaning community access TV instead of community antenna TV. Several have objected to placing the group in rec.arts, but there have been no alternative suggestions.

The newsgroups line would read:

rec.arts.tv.cable Discussion about cable and satellite television

This newsgroup would not be moderated. It distribution would be world-wide.

To vote, send mail to:

uop.edu!quack!vote-no	for no votes
uop.edu!quack!vote-yes	for yes votes

A daemon will pick out the "From:" line and add it to a file. No reply will be sent. Second call with vote list will be posted Tuesday the 3rd, and third call with vote list will be posted Tuesday the 10th.

The vote will end April 16, 2359 UTC, with the usual 5 day wait for late mail.

Any personal mail may be sent to ...quack!mrapple, but votes sent there will not be counted. Posted votes will not be counted.

Vote list as of 4/10/90, 0000 UTC:

No, California judicial systems that don't lock up criminals with a
history of violence are what killed those children in Stockton. If
Patrick Purdy had been left in jail the previous 6 times, they would
be alive now. (His own mother had him arrested once, and he has
assaulted police officers before as well)

Just when I thought it was safe for Jim to come out of the

kill file! You missed the point on the orig posting, (As usual!)
and are picking a poor "case" to discuss "blithering lunacy" about!

Hello, I've been following the radio modification thread for some time
but haven't seen any for my new radio.
So, if anyone knows how to modify the Yaesu FT-811 for extended tx/rx
please send e-mail or post a message.
I was a at a Ham Swap recently and someone was selling a modified FT-811
for some ridiculous price. Of course I asked him how to do it, he refused to
tell me, but offered to modify my radio for a fee! I wonder if he was a ham.
So anyway it looks like it is possible, I just need to know how.
Thank you for your time...

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

SPRING FLEA AT MIT
Sunday, April 15, 1989
9AM-4PM

Come to the city for a great flea - plenty of free parking.

MIT's semi-annual electronics and ham radio flea will take place on the Sunday of Patriot's Day weekend again this year.

There is tailgate space for over 200 sellers and free, off-street parking for 1000 cars!

Buyers admission is $1.50 (you get 50c off if you're lucky enough to have a copy of our add) and sellers spaces are $6.00-each at the gate

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall Square area from 9AM to 4PM, with sellers set-up time starting at 7AM. Have no fear of rain, a covered tailgate area is available (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)

THis shouldn't be too hard to get. In almost every episode where they
are in the garage gives a glimpse of the call sign. It is on a nameplate
(call plate) like you can get at any hamfest or engravers on top the
radio. The ham operator in the show is supposedly mr Tanner.

Antennas West markets a very fine black dacron line for antennas. The
black variety holds up good in the sun light. I think I paid around

$20 for 200 ft. It's about 3/16 inch in diameter and has a 700 lb. breaking strength.

Antennas West
Box 50062-c
Provo, UT 84605
(801)-373-8425

The 22 ga would work for ground radials, but it is kinda light. Use somehing more around 18 ga or so. Don't forget that there is current flowing in the radials and the losses go up as the ground system becomes less efficient.

Why just those two? Consider a well made and very fine transciever from Ten-Tec. Two models to chose from in that price range. Service, if needed, stands heads and shoulders above the rice-box send it in and we will give you a quote variety. You can actually fix these radios yourself. How novel.

For my money I would buy the American instead of the Japanese.

>AM/FM radios practically out of cereal boxes, but SW receivers are some
>other strange thing they sell at Radio Shack. At least the latter
>have stayed in the market.

I will heartily second this and venture some comments on the issue. One aspect of the "chicken-and-egg"ness of the situation is that it appears there is absolutely NO "trade press" for the SWL marketplace (and, actually, for the amateur marketplace, too). I get a consumer-electronics dealer publication called "Audio-Video International" -- with a name like that it would be a natural to include a section on shortwave radio and ham gear, even if not in every issue at least quarterly or thereabouts. I've filled out comment cards and the "suggested article" section of their bingo cards for *years* with comments and suggestions that they institute at least some coverage of this marketplace, but they ignore the field.

I know of no dealer-oriented publication anywhere in the consumer electronics field that even acknowledges the existence of the SWL market or even the larger (or at least more-varied-product) ham market. I believe no ham or SWL manufacturer displays their wares at the CES trade shows (except for what portable SW radios might show up in the Sony or Panasonic displays).

With no trade press or "push" from the manufacturers encouraging retailers to get interested in serving this market, few, if any (who are not already interested in the field due to their own personal hobby), will make any effort to address this field. So there are few stores selling these products, and thus little awareness of them in the general public, who learn about goods and services mainly through advertising and no one is buying general-media ads for this stuff because the only dealers are small specialized or mail-order places who wither cannot afford to buy such ads or can't justify the expense on the expected return from such "cold" ads or "informational" ads.

As a side issue, the only periodical outside the electronics-hobbyist press I've even seen any detailed or worthwhile coverage of shortwave radio in is "American Survival Guide", a survivalist monthly that has articles on ham gear and shortwave in amongst the ones on emergency medicine, food growing and storage, and weaponry. And that serves another limited-scope specialized audience, anyway. What we need is the same degree of coverage in the general media as they give to VCRs and camcorders -- not an awful lot, and not terribly accurate, but at least *something*.

Mentioning Radio Shack and other retailers who *do* attempt to sell SW reminds me of an amusing (or disenheartening :-) incident from about 17 or 18 or so years ago. I was at one of those "catalog outlet" type stores in central Illinois while on vacation -- one of those places that has a sample of everything displayed and you request what you want at an order window and the stuff comes out of the bowels of the warehouse in back or below in a bin on a conveyor. I was looking at some Nordmende SW radios and the guy who was waiting on me turned out to be the store manager. I tuned around on it and made some comments to my wife and the guy realized I knew something about shortwave and started asking questions. I explained a bit about what bands got the best reception at what times of day and the guy offered me a job then and there! I think I was the first person he had encountered who appeared to know anything at all about consumer electronics and SW in particular... :-) What this illustrates is that this is a kind of product that requires knowledge on the part of the salesperson, and that may be next to impossible to find these days -- the stores cannot afford to pay enough to the salespeople to keep anyone knowledgeable enough to sell the stuff; those people will find better jobs easily and quickly, and the markup and volume sold can't provide enough sales commission to support competitive pay. That situation won't change until the general level of technical knowledge in the population rises; since it appears to be headed down, instead, things are not likely to improve... Radio Shack makes some attempt to train its sales force, I suppose, but they have to emphasize the higher-volume and more profitable aspects, and the one or two SW radios they sell get left out. So you're not likely to find an SW-knowledgeable clerk at RS, either.

Regards, Will

Apologies to the net.

John, tried to send e-mail to the address you gave us at Winterail, but our mailer's not smart enough or something. Please send me an e-mail msg and I'll reply by the return route.

Enjoyed meeting you this past weekend. Hope we can continue to merge our ham radio, railroad, photo, and history hobbies.

73--Jim, K6ZH

Subject: Heathkit catalog

The airplane was the first heathkit and the scope was the first electronic kit. However I don't believe the big sloping console analog computer was their first. They also made a much smaller analog computer in a rectangular box that I used in high school. I recall the bigger unit becomming available after our unit was up and working and those who really knew how to use it wanted to upgrade, but the administrators said NO! I used to have one of the first scopes (serial no in the 20s), but the pots were too gummed up and it was too big for my limited needs. Years ago one of their catalogs had a history of the company. It was quite interesting.

Thanks for all the people who helped me with my grid square question.
Also, I wish to note that I am WELL AWARE that I am not at 40 degrees
it was a TYPO. The location I found was indeed 45 degrees, etc
{Sister Bay is grid EN65ke}

As for ALF, it was Melmacian (sp?) code, which sounded like "H" in Morse code to me. There have been a few episodes where Willy and or Alf uses the radio. If anyone saw part two of that two parter (the one a week or so ago), please e-mail me a synopsis (I missed it). [NOTE:I normally don't watch the show, but I saw part 1 and am curious]

Well, I wasted enough bandwidth.

Herewith follows my opinion on the so-called "NO CODE LICENSE"

In the beginning there was spark gap and CW, or to be more correct interrupted continuous wave (ICW). Therefore there was a need to test would-be amateur radio operators in rules, regulations, *AND* operating proficiency in ICW.

This is 1990. We have not only ICW available, but also AM, FM, SSB, NBFM, RTTY, PACKET, MCW, etc., etc.

Therefore, I propose that the amateur bands be broken up into exclusive segments for each mode of operation. No longer will CW be allowed anywhere in a band.

I also propose, that the would-be amateur radio operator be required to take a test for *HIS* mode of operation in addition to the required test in rules and regulations.

Call signs would be issued based on the mode of operation in order to police the bands. i.e. PA3xxxx for Packet License in the 3rd call area. CW3xxxx for CW License in the 3rd call area. etc. The prefix would designate the mode of operation. Naturally to avoid confusion with calls of other countries a complete world-wide re-issuance of call signs would be needed.

I think this would appease those who claim "my call is like my name, I don't want to change it." (shades of incentive licensing). But, just think, if you operate three different modes, you'll have three different calls.....just like a - first name - middle name - and last name.

Note to possible ARRL officials:

Please consider the above when next attending a League policy meeting. Thank you.

I need the following tubes, which (i believe) are british designations). If anyone can cross-reference or provide a source, it would be appreciated

KTW61 or KTW62 or KTW63

X65 or X66

MHLD6 or DL63

Y61 or Y63 or 6U5

THanks!

"I have this friend" with a wilson walkie talkie (15 yrs old) with a very noisy scratchie volume control. "This friend" tried using radio shack tuner cleaner on the volume and squelch control with the result of no scratch, no noise, no audio.

Was is the best recovery from this dopey move? Degreaser? a quick pass through the knits/gentle cycle (with no spin dry?) Or my all time favorite, a gasoline rinse by candlelight.

Thanks for your patience and help. "Your friend" Bradshaw.

The last time I delt with Kenwood was to get a replacement LCD for my TR-2500. As some of you might recall, the display had a tendency to become unreadable after a few years. I called Kenwood, told them about my problem (they were aware that the LCD in the 2500 had this problem). The sent me a new LCD free, no questions asked.

> HF mobile, by the way, is great fun! 20m can be frustrating, but 15m DX right
> now is almost as good, sometimes even better, and 40m daytime ragchewing isn't

Wanna be on the RECEIVING end of a PILEUP ??

Take your MOBILE HF out to a county line, especially if one or both counties is low in ham population... and check into one of the COUNTY HUNTERS' NETS. (It's been 13-14 years, so I don't remember the freqs. on 75 and 20...)

Mobile HF is often more impressive to a non-ham, too, than 2 meters...

73, & good luck,

Bob ("I got those small car blues, too!") wa8ycd

In Message-ID: <35125@genrad.UUCP> Diana Syriac asks how common it is to be able to send code with either hand......

I am a mixed-mode operator (phone,CW,digital) but I particularly enjoy CW and always have. I know many CW operators and have encountered *very* few who can send with either hand. Most of the CW ops I know can send with only one hand and generally write with the same hand. This is particularly distracting when handling NTS traffic or operating a CW contest because one has to drop the pencil each time he needs to make an entry in the log. (Well, if you're using a computer contest logging program that sends CW for you this isn't true!) I send with my right hand and write left-handed, which is a real blessing.....

Reference increasing code speed...

These are some general comments and/or observations after passing the test myself and working with about a dozen others at various speeds. Before you read this, review the meaning of the abbreviation "IMHO."

IMHO:

* PUSH A LITTLE. Listen to faster than you can copy and "push the envelope". I like to have my 20wpm folks listen to W1AW or whatever source at higher for a while and then slow to the target speed. W1AW sends at 35,30,25,20 (,15,10...) So we listen through 20 and quit. I tell 'em not to worry if they can't write it all down at 35 and 30 (I can't!) but LISTEN to aid concentration and quicken recognition. MOST of the observe they can hear "the", "and", "of" and other short, common words.

  If you're using a computer, set the speed up to 25 for about five minutes. You'll do really rotten. Then slow down to no less than 20. It really sounds slower.

  If you are still at 13 or so, trying to build toward 20, I recommend that you USE THE FARNSWORTH METHOD! It really does make a difference.

* BE REGULAR. Spend some time EVERY DAY. Even if just a little bit. It's tough between work, school, family, other activities, but it only needs last until you pass that test! (Unless you really get hooked on CW!) An hour a day is terriffic! Half an hour per day is good. Even only TEN MINUTES PER DAY EVERY DAY is better than ONE HOUR ONCE A WEEK. Sometimes it helps if you have someone else to work with, because the other person helps keep you on schedule, encourages you when you do well, rags on you when you slack off.

* CONCENTRATE. Keep up the pacing. I HAVE DIFFICULTY WITH THIS MYSELF. When you miss a character (or word) FORGET ABOUT IT. Don't spend time flustering over it while other characters (or words!) are still being sent. Leave a space or draw an underline or SOMETHING, but keep your concentration ON. Keep up with the speed. Some folks can hear the code but can't write fast enough.

  If you have time afterward, maybe you can figure out what it was.

* SEND. The rules, or the popular interpretation of the rules, do not require you to send. I don't know of a VEC that tests sending, and the rules say you can't flunk for bad sending.

  When you send, you are translating the code from the abstract letter symbol to a definite action. (You press the key for a short while, wait a short while and press the key for a three short whiles and wait three short whiles. That's an "A".)

  If you're working by yourself, you don't really NEED an oscillator. You can tap on a table, steering wheel, your knee, etc. What you are learning to associate with the letter symbol is the muscle contraction (wrist motion). That's fairly personal. You can touch your nose because you "know" where it is. You learn an "A" because you "know" the pattern.

(most important!) DON'T GIVE UP! Some folks take longer than others. Some folks have more time to devote to it. Some folks are more committed (some say I *should* be! :-)) I really believe the part in the movie "Stand and Deliver" where the teacher talks about "ganess" (howzat spelled?) the *desire* to do what it takes. Self confidence makes a big difference. It's not "DON'T GIVE UP ON THE CODE," but "DON'T GIVE UP ON YOURSELF!"

TRUTH TIME:

OK, I admit it. When my 1-year, non-renewable Novice ticket was about to expire, I was *not* ready to pass the 13 wpm test. So I was a Technician for a few years. I FLUNKED THE 13 WPM TEST SEVEN -COUNT'EM- SEVEN TIMES AT THE FCC FIELD ENGINEER'S OFFICE IN PITTSBURGH. The EIGHTH time was a charm. A buddy and I worked together, harassing each other into not slacking off and encouraging other (maybe a little competetive?) and we both passed that day.

I kinda laid off the code for a while, and was even "out of" ham radio for a while (2m FM only) and on the 20th anniversary of my first Novice QSO I got sentimental and started messing around with code again. I was amazed how fast I was able to reinforce the code. Also, the new VE exams were, it seemed, easier. I sat down at the exam at a hamfest and thought, "Oh, what the heck! If I flunk it now, I can go take it again in three weeks at the session in Dallas!" NO PRESSURE. NO 30-DAY WAIT. NO INTIMIDATING FCC OFFICE. Whaddya know! I passed!

As a final, general observation, I would hazard the opinion that our worst obstacle is ourselves.

Good luck,

Bob West WA8YCD

Can't predict local interference results, but would recommend you try a High-Q "Army-loop" type, or more specifically, the "Ted Hart" version of the Army-loop....described in the latest ARRL Antenna Book (15th ed).

Ted Hart wrote that section. Instead of using large copper tubing as they suggest, use low-cost aluminum lawn-edging...available in hardware stores. It is about 4" wide and comes in rolls of 20' and 40'. You can flatten out the corrugations. I have used this quick, easy, lo-cost scheme in the attic of my garage on 20, 40, 80, and of course it can be used on any of the bands except 160 which would be too large to be practical indoors. (also a wider width 7"? is also available). A neat trick is to overlap the ends at the top of the vertical loop and sandwich styrofoam dielectric in between to form the tuning capacitance. This avoids losses by otherwise making connections to a tuning capacitor... which is very important because the high-Q circulating currents may approach 100 amps?. It must be high-Q (and of course narrow-band) to perform properly. It is very easy to feed...just attach the shield of the 50-ohm feed coax to the bottom-center, and the center of the coax simply extends 2' to 4' to experimentally get a perfect 1:1 SWR. It usually is better to put some capacitance in series with this wire. It can be considered a "Gamma-match". Small alligator-clips can be used to clip on to the aluminum. I used a double-layer 20' perimeter on 20 meters (doubled a 40' roll). This provided extra layers at the open-top end to sandwich in more sections of capacitance-overlap as required.

I have not gone back to try this scheme on 40 meters but may go back and try it there...perhaps using the 7" width (I previously attached extra metal sheets to get enough capacitance for 80 meters). I suggest that if you use a double-layer for the 40' perimeter, you can separate the ends at the top, fold them back in the form of a double "J"....do the same on the other end, and when you mesh them together at the top, you will be able to insert 5 pieces of styrofoam dielectric which should provide sufficient capacitance without arcing across...certainly on 40 meters and even possibly on 80 meters. You would however, probably be limited to 100 watts to avoid arc-over.

My 40/80 meter loop is 40' perimeter (7' high and 13' wide rectangle) in the attic of my garage which even has aluminum siding on it. The bottom of the loop lays directly on the wood attic floor...everything else supported by nylon cords. I have tested this scheme quite a bit and get very good results. I have also used 1000 watts sometimes, but arc-over can be quite a problem if the spacing is too close. If you try this and have good results, please report back to me, or to this net because I feel a lot of people in limited circumstances (space or finance) could benefit. Many people are not inclined to believe that it can work so well (Read the ARRL ref. mentioned above for some encouragement).

By the way, if you have a grid-dipper, it can be pre-tuned by simply shunting a 3' or 4' test-lead at the bottom of the loop. Put a 1-turn half-knot in it to insert the grid-dipper coil. (It may "look" like you're shorting out the test-lead with a big 4" wide dead short, but not-so because of the Hi-Q. Alternately, you can "listen" in general-coverage and note where you get a "noise-peak", or if you're in the ham-bands, you can simply try loading it to experimentally adjust the Gamma for a perfect SWR.

By the way, in case you don't read the reference, I should emphasize that this is a "vertical-loop"...not horizontal. Round is best, octagon is second best, square is 3rd and rectangle is last (Wants to enclose as much "area" as possible for a given perimeter. Good luck!

I'm glad you asked! This may not directly solve your problem on CW and especially on a random frequency, but I am thinking of starting a campaign to suggest how all "phone nets" can get on precisely the same frequency.

My suggestions are based on the assumption that the large majority of tranceivers are digital/synthesized, read only to 0.1 Mhz on the main display, and have the option of tuning in exactly 1 Khz steps where it necessarily stops precisely on a full digit. My Icom 751 does this and I feel pretty sure that other similar equipment does the same.

1. Have all nets agree to use a "full" digit (no 0.1 Khz fractions).
2. Have all participants leave their main tuning in the "1 Khz-step" mode only, to step to the desired digit.
3. Henceforth, DO NOT TOUCH the main dial....use only RIT (Receive Incremental Tuning, or whatever descriptive term is used).
   Thus each person can set his RIT to suit his own personal taste with only one setting and everyone will automatically suit "his ear"!

Of course all the above depends on the transceiver being precisely calibrated to WWV, and I suggest the following:

1. Using the same 1 Khz-step mode only, set WWV upper-sideband on VFO A, and WWV lower-sideband on VFO B so that you can quickly toggle between them. BE SURE to have your RIT cleared to zero! (Alternately, I set WWV 5 Mhz in Memory-channel 1 & 2, 10 Mhz in 5 & 6, 15 Mhz in 9 & 10,

using the gaps between sets so as not to accidentally toggle WWV on two different frequencies, since the transceivers are not absolutely perfect)

2. Now wait for WWV to send their "musical tone" (not preset during some intervals), and simply "tweak" your calibrator until your ear tells you that the two musical tones match, as you toggle quickly between upper and lower sideband. I feel certain that almost everyone has a good enough "ear" to recognize when the tones match!

   By the way, if you thought you were good at tuning in speech properly...try first "tweaking" your calibrator until you think the voice sounds natural (do this before the tone test)...then use the comparative-tone test and see how many cycles you missed.

Any disagreements? 73 W9RWZ

What combination of L-R or R-C would simulate the "standard" 160-190 Khz lowfer transmit antenna (15 Meter vertical, with some sort of top hat).

Will Martin, I saw your post, and thought I would give some of my own perspective on the ARF and other nets that can be heard on 3950 khz.

You either love this kind of amateur radio, or you hate it. I love it, obviously, as you can see from MY signature block, I participate in BOTH nets...

3950 has always been a different kind of frequency as long as I can remember. I once wrote an article (It is lost here somewhere) on the frequency that goes back to the 1960's when I first started listening to this fascinating frequency.

The Amateur Radio Forum, with NR9Q began about three years ago as a spinoff of the "Liberty Net" which is also heard on 3950. Jack had an idea for a more organized discussion group which would be topic oriented, and I would say the net has been quite a success, and has grown in concept to become my favorite net. Thursdays at 10 Eastern (9 central, and you can do the rest) the group gets together to discuss current events, and usually one particular topic.

More recently, Jack has begun to have on Guests, and the amateurs checking in can query them. The guests run the gamut of the political spectrum from the Louis Farakan camp to the David Duke camp... From a scientist at the field museum to a honcho from the ACLU.

I want to stress that these nets are NOT broadcasts. The hams are all in "point to point" communication, even though I know there are lots of SWL's tuned in because the nets are so interesting. Some pretty firey discussions have taken place.

ARF is a lot better than your regular "talk show" ... This is because of the nature of ham radio. There is no way to "hang up" on someone, so everyone gets their say, although there is a 3 minute time limit (hey try and get 3 minutes from Larry King!)...

ARF is not the only such net on 3950. You might also want to check out:
Freeman's Net (Thurs 10PM EST) NCS W9OAG
  Devoted to Law, Constitution, History...

Liberty Net (Sat 10PM EST) NCS W1WCR
  Devoted to current events and news

Christian Investigator Net (Mon 10PM EST) NCS WA9D
  (IMHO Neither Christian Nor Investigative, but somewhat muddled)
  A potpouri of somewhat confused religious discussions

Most nights in the late hours, you will hear many discussions on various topics from Psychic Phenomena to Gun Control on 3950. Often the discussions get heated, and it makes for what I consider GOOD HAM RADIO.

3950 is seldom boring. To really sample the frequency before you make up your mind, give it about a week or two of sample tune ins...

And YES you will hear "The Eccentric Old Hippie" from Marquette check in quite often.

When I am there, you will hear USENET discussed. I am the sysadmin of LOPEZ in real life.

Will, you asked one question that I did not respond to in my previous posting...

The Saturday net on 14.313 is NOT a tape, it is a chance for folks who would not normally hear the net get a chance to participate.

You might realize that running a net on 14.313 is a challenge, since at the moment this frequency is a hot bed of confrontation, but that makes it an ideal place to hold a controvercial discussion group.

Mike WA9D has been trying to take over the frequency several saturdays in a row (THE DOG IS BACK FOLKS....)

Surprisingly there have been some GREAT saturday ARF groups...

Hope some of you folks will check in to the Thursday or Saturday ARF nets... the more the merrier....

Ham radio is a heck of a lot more than "Gud luck in the contest"...

73

Gary, WB8 Equal Opportunity Heckler....

Hi everyone,
 I have been put in charge of a club project to work some satellite contacts
 this year during Field Day. I have access to about all of the necessary
 equipment (rigs, antennas, etc.) but I'm not too knowledgeable when it comes
 to working the satellites. We (the First State ARC, Wilmington, DEL) will
 probably settle on mode JL on OSCAR 13. I would like to know about anything
 that I should watch for, operating hints, etc. In other words, anything that
 might make this task a little easier for someone who mainly relies on the
 terrestrial modes of propagation at VHF.  Thanks in advance.

This proposal by the FCC is basically going to mess up the entire process of licensing hams other than General/Advanced/Extra. Perhaps THAT ITSELF is intended by someone as an incentive to upgrade.

Still, since some people ONLY want the VHF/UHF privileges, they are not interested in "upgrading" but will be stuck with signing some suffix for the rest of their lives unless they got the Tech before the change (if we less this foolish thing go on).

The confusion alone could further reduce the number of new hams entering the hobby.

In accord with my foolish but "traditional" role as one of the extreme lunatic fringe voices on Usenet who publically speaks the unspeakable about security issues created by clever seeming technology (and finds his articles republished without permission in what seems like almost every hacker/phreak publication as a consequence), I have some questions about Lojack security, now the subject has been broached on rec.ham-radio. (Lojack is a Boston based startup company btw).

Why is it not possible to detect a Lojack equiped car by looking for local oscillator leakage radiation from the command receiver ? I would think thieves would carry suitable receivers with them and either avoid cars radiating on the LO frequency or take special precautions when stealing them (like carting them off in a well shielded enclosed truck - a big Faraday cage). And certainly finding where the Lojack unit was hidden would be easier with a near field sniffer probe and an "S" meter on a receiver tuned to the LO.

And if you know the vehicle is Lojack equiped, why not simply jam the command frequency with a small portable transmitter ? I doubt the command signals from the the Lojack activation sites are anywhere near as powerful as even a few milliwatts radiated right next to the command receiver in the Lojack box (or into the vehicle wiring). And the potential of DF'ing the jamming (and thereby finding the thieves) might be greatly reduced by using lookthrough jamming (only turning the jamming transmitter on for a brief burst when a command packet from the Lojack activation sites is detected). I am sure there are optimum jamming modulations that disrupt the parity on a command packet and render it useless while still retaining a relatively low duty cycle and high off time to on time ratio.

And certainly the well equiped thief would want a receiver tuned to the homing frequency to warn him that the car he was stealing was broadcasting so he could ditch it and get away (after first disconnecting the car battery so the nicad in the Lojack unit would have a chance to run down and stop broadcasting if the police didn't find the car in time).

I suppose the Lojack scheme is useful in the face of these problems because most car thieves aren't very sophisticated. I understand, however, that the kind that steal expensive late model cars (what Lojack aims its marketing at) for parts ("chop shops") are pretty sophisticated and could be expected to use these approaches to defeat the system if it becomes at all common.

But still ...

How about just use calls like WPA3xxxx and WCW3xxxx?

> I think this would appease those who claim "my call is like my name,
> I don't want to change it." (shades of incentive licensing). But,
> just think, if you operate three different modes, you'll have three
> different calls.....just like a - first name - middle name - and
> last name.

So shall I just call you NARATIL?   Or maybe WCW3BNRX?

Also, I would like to add a proposal that allows the use of a set of
very short calls for contest operation. The call W3 would be shared
by all contesters in area 3, for instance. Thus an exchange might
go like:

W3 UR 599 QRZ W9

Surely all contesters will love this since the time it takes to make a
contact will be shorter than ever before. And they can program both
calls into a memory unit just like they do now for the signal report.

Better yet, forget call areas and just go with W.

>coiled kind) and in older telephone handset cords.  It is not the same
>as Litz wire, since the individual conductors are not insulated (although

The individual strands of wire in Litz wire are NOT insulated from each other.
Litz wire is essentially LOTS AND LOTS   A N D   L O T S   of very fine (and
sometimes silver-coated) wire all twisted together. Because of the greater
surface area of such wire, it is supposed to have less impedance at RF
frequencies than normal single strand wire. (or wire with only a few strands)
By the way, Litz wire tends to be VERY flexible as well due to the large number
of strands.

              Steve

Oh, mygod, PLEASE dont't re-misuse QRA for the Maidenhead grid locator.

QRA? -> "What is the *name* of your station."

We (here in Europe) have enough confusion already having to live with TWO grid systems (the old one and the new one) The old one originally misnamed the QRA-locator system later renamed the QTH-locator. The new one here sometimes called the QTH-locator, sometimes called WW-loc or LOC on CW.

Chris.

>my RIGHT hand, so I can write with my left hand at the same time, if desired
>(which I sometimes do).

>But, when using someone else's iambic keyer wired the opposite way, I find
>that I can't use it with my right hand....but I CAN use it just slightly
>slower (1-2 wpm slower) with my LEFT hand....still with dashes on the thumb
>and dits on the forefinger. Again, I've tried using my left hand with my
>normal setup...and get confused easily, but with it wired exactly backwards
>from my normal mode, I can send just fine.

I had a right hand, left hand CW sending experience somewhat different from this. Some years ago when I actually used to use CW on the bands, I normally used my Heathkit keyer. However, I thought it was fun to use a straight key and that I should keep up my proficiency with it. However, after being used to the keyer, I had difficulty sending good code with the key. The old right hand just would not work properly. My CW was as good/bad as my handwriting (you wouldn't want to try to copy it). I had a bright idea; why not try my left hand with the key. Much to my amazement, I am not ambidextrous, I was able to send much better code with my left hand. So, for a while when I used CW, I would use my right hand for the keyer and my left hand for the straight key. It worked pretty well for me. This is also a trick that can be used when someone has developed a "bad fist" for CW. It amounts almost to starting over. This offers the advantage of training the other hand correctly. It can also be used to keep new hams from developing the habit of sending CW faster than the ability to receive it. This is quite common. By using the other hand, the speed will be slower, but more closely reflect the receiving ability of the ham. Try it, you might like it!

Alas, I never use CW now, but should start practicing. My main objection to CW is I cannot copy by ear and must write down each character. This probably is a result of my code interceptor MOS in the Army Security Agency when I copied coded number and letter groups at 40 - 45WPM. You don't pick up word copying skills this way, just automatically type the characters on the mill without ever even realizing what you are copying unless you stop to actually read what you have typed. The only exception to not knowing what you were copying was the ever present "QSA ?" inquiries on the net. With it operating 24 hours a day every day of the year, there were a lot of signal strength inquiries!!

A Heathkit catalog I received from them many years ago (maybe 20?) gave a short history of Heath. It said that Heath did indeed begin its corporate life as a vendor of airplane kits, specifically a monoplane called the Heath "Parasol." There is an example of the Parasol on display in the museum of the Experimental Aircraft Association in Oshkosh, Wisconsin. If memory serves me correctly, the article in the catalog indicated that the Heath Parasol was introduced circa 1929 and that Heath turned to electronic kits after World War II. Taking advantage of a glut of war-surplus electronic components, Heath introduced a reasonably-priced oscilloscope kit.

If this chronology is correct, I must wonder what Heath did during the Depression. Was the market for airplane kits sufficiently large during those difficult times to sustain Heath? Or was Heath in another business between the airplane kits and the electronic kits? By the way, the catalog article to which I refer reproduced a photograph of a Parasol in flight.

Could you imagine how the instruction manual for a Heathkit airplane would have been written? Something like:

( ) Attach inner aileron hinge to left wing with 1/4-20 x 1 1/4 bolts, lockwashers, and nuts at locations CA and CB (see Fig. 64a, foldout from page 229). Do not tighten at this time; hardware will be tightened after installation of aileron.

And the first line of the "Operation" section undoubtedly would have read:

Note: Operation of your Heath Parasol requires that you have
a valid pilot's license. Information concerning pilot licensing
may be obtained from any branch of the Federal Aviation Administration.

I wonder if Heath sold their airplane kits with the same slogan--you know,
the one which says:

"We won't let you fail!"

[several methods of defeating Lo-Jack car-finding, ...deleted]

The trouble with being technical is that we miss the true essence of the Lo-Jack invention. The purpose of Lo-Jack (company) is to create a lot of consumer interest, make a great splash, go public, and get out with a lot of money, Surely, David, living in Boston should make you more sensitive to that... :-)

There is more than one way to make money on stolen cars.

Most lowfer transmitters are designed for 50 ohm output; ordinary dummy loads work. Very roughly, a 30-foot vertical with 20'tophat might look like 400 pf in series with 75 ohms, and require 1.8 mh to resonate. Loading coils are usually coupled to the transmitter by a tap or link, and are tuned with a variometer (a few turns on a rotatable form inside the main coil, such that their inductance adds or subtracts from the total inductance).

Two comments on learning code and passing the code test:

A very effective way to get your speed up is to get involved with CW traffic handling. This way you actually get practice copying ON PAPER rather than just in your head. If you don't know the frequency of your local section traffic net, ask your ARRL section manager (address in the front of every issue of QST).

When you take the test, there is a little-known clue that can help you figure out the parts you missed. Every letter, number and standard punctuation mark must be used at least once in the text. If you copy a callsign as WA_XYZ and you can see that no other 6's have been used in the text, then you know it must be WA6XYZ. Ditto for letters. The unusual letters (Q, X, Z) are hard to use in the text so usually end up on one of the callsigns.

Re: trunk-mounted radios.

I have an old Drake UV-3 144/220/440 MHz radio with romote control head option. It allowed me to mount the rather large radio in my Volkswagen beetle under the rear seat next to the battery (short power leads) with the control head mounted in the glove box. I put a lock on the glove box so that, not only is the unit hard to see, it's hard to get to.

Many years ago, (like 20!) I built a grounded-grid linear using a pair
of 304TL's. It was a single band unit designed to generate around 1000W
at 3 MHz for an experiment being done by a grad student in the Physics
Dept at Wesleyan Univ (Conn) where I was a student at the time.

I don't remember what we did to stabilize it, but I don't think it was
anything special. I do remember the power supply was a surplus unit
rated at 1800 Volts 1+ Amps REGULATED. (C-V transformer)
It took 4 men and a boy to lift the power supply, but it worked great.

There be egg on this hoser's face. My recent posting regarding the MONITENNA model 5094 stated it is made by Motorola.

This is, of course, wrong. I was brain dead at the time of posting, and am not responsible for my actions.

The antenna is made by CHANNEL MASTER.

It is STILL the best scanner antenna you can buy. it runs rings around a $100 discone (albeit without the wide bandwidth, but in practice it picks up just dandy on frequencies that are not listed in its coverage specs)

The antenna is $40 from a dealer here, I am sure you can find it anywhere now that you know who REALLY makes it. (or write me and I can give you tha name of the local dealer who will mail it to you)

Sorry for the confusion.

I now have TWO of these antennas. I am getting stuff I never knew existed before. I have them at 40 feet and all I can say is WOW....

(Grove's catalog says it is the best antenna, but Grove does not ship it because it is so big, about 5 feet, but it goes fine UPS, I guess Grove's problem is finding storage space)

The antenna comes like an umbrella and includes all hardware, even comes with coax and a plug.

It is a MOTOROLA plug. I think that is where the brain files got linked, and I gave the wrong manufacturer.

Will you EVER forgive me....

Duh.

Oh, really? And how can it have greater (electrical) surface area if all the surfaces are in electrical contact? What keeps the current inside the fine wires and away from the bundle's surface? (Especially if it's silver plated.)

Maybe usage varies in different parts of the world, but around here Litz wire is most definitely made up of many fine wires all enamel-insulated from each other, with each wire brought out to the surface periodically. I had a funny feeling about this, due to some unanswered questions about proximity effect (my experience with Litz wire has been limited to few experimental switching-supply designs), so I looked it up in a couple of electronics dictionaries as well. They both indicated specifically that the wires are individually insulated.

Some additional information, as promised:

Radiokit (store is located at:)
P.O.Box 973 15 Londonderry Rd.
Pelham NH 03076 Londonderry NH 03053
(603) 437-2722
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. They seem to want $1 for the catalog.

BCD Electro
P. O. Box 450207
Garland TX 75045-0207
(214) 343-1770
$1 for 1-year subscription to catalogs, no minimum, $0.95 for under $30, $2.90 shipping. Surplus electronics, pretty random looking assortment. I haven't ordered from them (yet).

Oak Hills Research
P.O.Box 250
Luther MI 49656
This is W1FB (Doug Demaw). Send a SASE for a flyer. When last I got a flyer, he had a number of random parts aimed at QRP rig building; he also has a couple of kits for QRP transmitters.

Newark Electronics
Send catalog requests to:
Newark Electronics
ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email for your "local" distributor, or you can try calling one of the above numbers... They have a $25 minimum order; while they are a Real Distributor, and are probably most comfortable with gigantic orders, they say they welcome every customer, regardless of size, and were certainly happy to take my $30 order recently. They carry LOTS of stuff; in particular, semiconductors from Motorola, RCA, Sprague, TI, American Power Devices, Fagor, GE, International Devices INC, Intersil, International Rectifier, Precision Monolithics, Powerex, and others. They are very complete, except, of course, for my favorite scarce item, the air-variable capacitor...

And lastly, check out

NUTS & VOLTS MAGAZINE
P. O. Box 1111
Placentia CA 92670
1-800-783-4624 (subscriptions)
~80 pages each month of nothing but electronics classified ads. Individual issues are $2.00 (at least, that's the price on the cover), subscriptions are (third class mail, USA:) $12/1 year, $21/2 years, $60/life, (first class

mail USA) $20/1 year, (Canada/Mexico) US$22, (other foreign, air mail) US$55.
A subscription also entitles you to one free classified ad of 40 words.

I think I've run out. Anyone else?

In my experience, the only place to find people using 40 wpm+ cw is in
the US novice bands. These people are not necessarily novices. Also
IMHO, the people just above the US extra CW only bands usually are going
about 20-30 wpm. I have found most extras creeping along at only 15-18
wpm, in the extra CW only bands.

Well, it's probably ok to LISTEN on them....just be sure you realize that
it is illegal to transmit on them unless you are a member of the Civil Air
Patrol AND you have a CAP ROP card.  Keep in mind the frequencies are used
for communications for search and rescue (among other things), so interference
would be troublesome.

148.15, 143.9, 149.925, 26.62

There are a couple others, but I don't have my papers handy and the one used
the most (around here....not necessarily country wide) is 148.15.

The WB2OPA LogMaster HF logging system for IBM PCs and compatibles will
be demo'ed at the Sensible Solutions booth (#474), at the Dayton HamVention.
```

Amongst its many features are

- o Automatic beam headings.
- o QSO alert indicator to tell you if you need the QSO based on country, state, prefix, cq zone, itu zone or any combination for the current frequency and mode.
- o Auto dupe checking.
- o Metric to english/ english to metric conversion calculator.
- o Prints high quality QSL cards.
- o Keeps award statistics.
- o User configurable.
- o And much, much more.

Please drop by and say hello!

(sorry for any violations to this net's protocol)

WANTED:

Portable all-band receiver (like the old Zenith Trans-Oceanic)
Should be rugged and run off internal batteries.
Ability to run off external 12vdc (ship's power) would be a plus.
Normal broadcast FM, common short wave and ham freq a must.
Marine VHF would be a plus but not required.

I will use it for entertainment and WWV reception this summer on my summer off from work (gone sailing).

I'm not able to find too many reasonable NEW ones about. I know about
Radio Shack at $200 & $90 but have always been underwelmed by their products.
Their $200 radio seems ok, but not great (not at $200).

Offers & ideas......

Stranded wire has less skin-effect resistance than the equivalent solid wire, but much more than true litz wire with individually-insulated strands.

Some large/expensive stereo speaker cables are being marketed as "Litz" and are made of many very fine (but not individually insulated) strands.

Skin-effect resistance can be significant in large-diameter conductors at audio frequencies. Whether it makes noticeable difference over the length of speaker cables is another interminable argument for rec.audio (like the one about mercury-filled plastic tubes which were supposed to give your speakers a more "fluid" sound. :-)

Here's a list of AWG copper wire sizes and their "critical frequencies" (frequency above which skin effect causes resistance to be significantly greater than DC resistance). I don't know the criteria for "significantly greater." The table partially reproduced below was in the Canadian LF/VLF newsletter _Northern Observer_ issue #9 (April 1989).

AWG size	dia. mm	critical freq.
1	7.35	586 Hz
2	6.54	738
4	5.19	1017
6	4.12	1.87 kHz
8	3.26	2.97
10	2.59	4.72
12	2.05	7.50
14	1.63	11.9
16	1.29	19.0
20	.812	48.0
22	.644	76.3
28	.321	307
32	.202	775
36	.127	1.96 MHz
40	.080	4.96

In addition to skin effect, wire resistance can increase by "proximity effect" where a strong magnetic field forces the current toward one side of the conductor. That's a reason why some cyclotron magnets are wound with flat "wire."

As I recall, an easy way to get the 26.62 frequencies was to use an old
crystal controlled CB radio and swap the channel 10 Tx and Rx crystals.
(I used to be communications officer for our squadron back in Virginia.)

One thing to bear in mind: if you are trying to work "up" to a certain speed you may be going at it the wrong way. You need to form a mental mapping between the sounds and the letters being received or sent, independent of any mnemonic device. If you use any sort of mnemonic device to remember the code, or you have to "think" at any time about it, there will be a much lower upper-bound on the fastest speed you can recognise or send. It is like reading; you don't spell out each word individually and figure it out from that, you recognize each word by its pattern. This is why people say "the only way to do it is to practice," because with practice you make this association.   But you can learn faster if you start out by consciously avoiding doing anything that will hinder you later.

My personal opinion (yours may differ :-)) is that you should start out learning the code fast. This prevents you from using any mental "crutches" or mnemonic devices and forces you to form the group associations from the start. Otherwise you are likely to (possibly unwittingly) learn memory-aids that won't work above a certain speed.

Subject: ICOM computer interface protocol (long)
From: carlc@tekgen.TEK.COM (Carl Clawson)
Date: 15 Mar 88 21:51:28 GMT
[Via KA2UGQ]

A recent poster inquired about the computer interface on the newer ICOM rigs. I recently got my hands on the information, and I thought I'd pass it along to the net.

I will be glad to hear about any corrections or additions to this material. I have not extensively tested all of these codes -- my trusty KAYPRO went to lunch on me in the middle of the job -- so there may be some "gotchas" that I haven't yet discovered. I have tested enough of them to be reasonably sure that I know what's going on.

Computer Control of ICOM Amateur Gear

Carl Clawson, N7KBV

General Description

Several ICOM products feature a built-in computer interface connected to a 1/8" phone jack on the rear panel. However, ICOM gives no information about this interface in the instruction manuals that I've seen. The information exists within ICOM, and my dealer managed to get it for me.

This interface, called the "CI-V" by ICOM, is standard on the following models: 735, 761, 275, 375, 475, and R7000. Earlier models used the CI-IV parallel interface, which can be connected to CI-V by ICOM's UX-14 converter. Models using the CI-IV are the 751, 271, 471, 1271, and R71. The information I got from ICOM was written with the 735 in mind, but a listing of a BASIC program to control the R7000 was appended. I believe it will help with the other models, too. The control codes and data format should be the same for all of them.

The computer interface allows you to do such things as:

- Set and read the frequency and modulation mode

- Set VFO A, VFO B, or memory mode

- Select memory channel

- Store displayed frequency into memory

- Transfer displayed memory-mode frequency to a VFO

Even without a computer, you can run a cable between the remote control jacks of two rigs, and whenever the frequency or modulation mode of either is changed, the other will track it if possible. (If the rigs have incompatible frequency coverages, like the 735 and R7000, funny things can happen.)

The interface is bi-directional, using TTL levels on a single line for sending and receiving serial ASCII data. You may need an appropriate hardware interface to convert, for example, RS232 to TTL. (I understand that Commodore computers have TTL inputs and outputs so that no interface is needed with them.) I used the Motorola MC1488 and MC1489 chips powered by two 9-volt batteries to interface to my RS232 line. Appendix 1 lists the pinouts used for this interface. If you'd rather buy something, ICOM sells the model CT-17 level converter for RS232.

The interface uses a "carrier-sense, multiple-access with collision detection" local area network protocol, so that multiple rigs can be connected in parallel without difficulty. Thus, you can use the same RS232 line and level-converter interface to control many rigs. Each rig must have a unique address, which is set by internal jumpers. Each model comes factory preset to its own address, which is 04 for the 735 and 08 for the R7000. Appendix 2 has information on the jumper settings.

I will use the words "receive" and "send" to refer to data transmission. Thus a "receiver" isn't necessarily an R7000; it's any device receiving data from the CI-V bus. I will use the word "rig" to mean an ICOM product using the CI-V interface.

Data Format

The rigs send and receive data in variable length packets, which are formatted as follows:

Byte #	Contents
1	hex 'FE' (i.e. 11111110 binary, 254 decimal)
2	hex 'FE'
3	<RX>
4	<TX>
5	<Code>
6-n	<BCD data of variable length>
n+1	hex 'FD'

The two hexadecimal FE bytes signal the beginning of a packet, and the FD byte signals the end. <Code> is the control code sent by the computer to the rig, which determines the action that the rig will take. In some cases, the receiving rig will include a control code in its response to the sender; see the section "Control Codes and Responses" below. <TX> is the address of the device sending the data, and <RX> is the address to which the data is being sent. When a rig responds to a data packet, it addresses that response to the <TX> in the packet. Thus, if your computer requests a rig to report its frequency, it will address that report to the computer and other rigs will ignore the data.

(Of course, the computer can lie about its address and trick one rig into talking to another!) Your computer should use its own unique, non-zero address on the network. I will assume in the examples that the computer is at address 02. There are two control codes that can cause any rig on the network to respond when sent with <RX>=0; I discuss these below.

Bytes #6 through #n contain any data required by the control code, in BCD format with 2 decimal digits per byte. Frequency data is sent starting with the byte containing the 1-Hz and 10-Hz digits. These digits are sent even if they are not used by the rig, so that the data format is the same for all rigs regardless of their frequency coverage and resolution. For example, consider the frequency 25.13244 MHz. This is broken up into two-digit groups:

```
25  13  24  40
```

It is then coded in BCD. In other words, consider each digit group to be a hexadecimal number instead of decimal. The decimal values of these BCD digit groups are 2x16+5=37, 1x16+3=19, 2x16+4=36, and 4x16+0=64. Now send these groups, starting with the least significant. The complete data packet will be, in hexadecimal,

```
FE  FE  <RX>  <TX>  <Code>  40  24  13  25  FD
```

If you have more than one rig on the network you may occasionally receive a sequence of 5 bytes of hex 'FC'. This is the "jammer code" used by a rig to indicate that a collision has occurred. Each rig, when sending, monitors the interface. If it does not receive exactly what it sent, then a collision occurred, i.e., another rig was sending data at the same time. If a rig detects a collision when sending a packet, it will wait until the network is idle, then send the jammer code. A rig that receives this code will realize that a collision has occurred and ignore the previously received packet. Because the ICOM remote control ports are bi-directional, your computer will receive everything it sends, so you can check for collisions from your computer, too.

Control Codes and Responses

Most of the following codes are addressed to a specific rig, which addresses an acknowledgement packet to the <TX> contained in the control packet. The first two codes, 00 and 01, can be sent to the "group call address" of 00, in which case any rig will receive them without sending an acknowledgement. These two codes are sent in this way by any rig when its mode or frequency is changed by manual control, and are received by any rig on the network. This allows a number of rigs to track each other in frequency and mode without computer intervention. Rigs can be inhibited from sending and receiving group call packets by an internal

jumper. See Appendix 2 for more details. These codes can also be sent with a specific, non-zero <RX>, in which case they will be received by the addressed rig even if the group call function is disabled.

00 Set frequency. See above for format of frequency data. See code 05 below for more details.

01 Set modulation mode. One or two data bytes are required to indicate the mode desired.

Data	Mode
00	LSB
01	USB
02	AM
03	CW
04	RTTY
05	FM
05 00	SSB (R7000)

02 Report tuning range. No data required. The rig will report its frequency limits in the format

```
FE FE <RX> <TX> 02 <upper limit> 2D <lower limit> FD
```

(Hex 2D is the ASCII hyphen.) According to ICOM, some rigs report the lower limit first.

03 Report frequency. No data required. The addressed rig returns its displayed frequency to the sender in the format

```
FE FE <RX> <TX> 03 <Frequency> FD
```

04 Report modulation mode. No data required. The addressed rig returns its mode to the sender using the codes listed above. Rigs with selectable bandwidth return an additional byte indicating the bandwidth. The format of the response is

```
FE FE <RX> <TX> 04 <Mode> <Bandwidth> FD
```

The bandwidth codes are:

Data	Bandwidth
01	Width 1 (widest)
02	Width 2 (narrower)
03	Width 3 (narrowest)

05 Set frequency. The data format is given above. If the data contains fewer digits than the rig uses, the digits sent will be changed and the rest will remain the same. If the rig receives valid frequency data within its tuning range, it responds with a packet containing the data "FB":

```
FE FE <RX> <TX> FB FD
```

If it didn't like the data, it responds with the data "FA":

FE FE <RX> <TX> FA FD

These acknowledgement codes are used by all following commands.

The 735 responds to out-of-range frequency data by sending the "FA" acknowledgement and: 1) If the frequency it receives is less than 0.1 MHz, it sets its frequency to 0.1 MHz, 2) If it received 4 bytes of frequency data that is more than 30 MHz, it sets itself to 30 MHz, and 3) If it received more than 4 bytes of frequency data, the data is ignored.

06 Set modulation mode. If one byte is sent, it sets the mode per the above table. If two bytes are sent, the second is the IF bandwidth.

07 Set VFO status. If no data is sent, the rig changes from MEMORY mode to VFO mode. If data 00 or 01 is sent, the rig sets VFO A or VFO B respectively.

08 Set memory channel. If no data is sent, the rig changes from VFO mode to MEMORY mode. If BCD channel data is sent, the rig changes to that memory channel.

09 Store displayed frequency and mode into displayed memory channel. No data required.

0A Write frequency and mode from displayed memory channel to a VFO. No data required.

Examples

I will give a few examples of codes and responses for the 735. The 735 is at address 04 and the computer is at 02. First, let's find out what's in memory channel 1 (code 08 to set the channel, and code 03 to read the frequency). Assume the 735 has the frequency 7.12750 MHz stored in memory #1.

Computer to 735:

```
FE FE 04 02 08 01 FD
```

735 to computer:

```
FE FE 02 04 FB FD
```

Computer to 735:

```
FE FE 04 02 03 FD
```

735 to computer:

```
FE FE 02 04 03 00 75 12 07 FD
```

Now let's change the frequency and mode to 14.02500 MHz USB (codes 05 and 06).

Computer to 735:

```
FE FE 04 02 05 00 50 02 14 FD
```

735 to computer:

```
FE FE 02 04 FB FD
```

Computer to 735:

```
FE FE 04 02 06 01 FD
```

735 to computer:

```
FE FE 02 04 FB FD
```

Now store the changed result back into memory #1. This channel is already displayed, so we need only the store command, code 09.

Computer to 735:

```
FE FE 04 02 09 FD
```

735 to computer:

```
FE FE 02 04 FB FD
```

Appendix 1 -- RS232 to TTL converter

This is an easily built converter that will run your ICOM gear from a standard RS232 line. It can be built in an hour or two for about $10. The converter uses two inexpensive, widely-available chips -- the Motorola MC1488 line driver and MC1489 line receiver. The only other components needed are a box, connectors, a power switch, and a couple .01 or .1 capacitors to bypass the power supply leads. I used two 9V batteries for power. Power for the 1488 can be +-9 to +-15 volts, and the 1489 requires +5 to +10 volts. With a suitable DC-DC converter chip and a 78L05 or 78L08, you could power the circuit off of your 13.8-V supply. Or, if you're clever, figure out a way to trickle charge two 9V nicads off of your RS232 line.

The pinouts are as follows:

For the 1488 -

Pin	Connect to
1	-V
2	ICOM remote jack center conductor
3	RS232 pin 3 (RD)
7	Ground
14	+V

For the 1489 -

Pin	Connect to
1	RS232 pin 2 (TD)

3	ICOM remote jack center conductor
7	Ground
14	+V

Ground pin 7 of the RS232 line and the outer conductor of the ICOM remote jack, and you're on line.

Appendix 2 -- Jumper Selections

There are jumpers in the ICOM rigs to set the device address, baud rate, and to enable the group call feature. You must look on the schematic to find them. The jumper to enable the group call feature is called the "transceive" bit by ICOM, and may be labeled with "TRV" on the schematic. The others are labeled "DBn" on the 735 and R7000; look for something similar. The rigs are factory-set to 1200 baud, transceive enabled.

I have specific information from ICOM on the 735 jumpers, and for the R7000 I have a likely guess based on the 735 codes and the schematic.

For the 735 -

The jumpers use lines labeled DB0 through DB5 at connector J22 on the PL board. Lines DB0 through DB2 set the device address. Line DB3 is the transceive enable. The baud rate is controlled by DB4 and DB5 according to

DB4	DB5	Baud
0	0	undefined
1	0	9600
0	1	1200
1	1	300

The 735 is set at the factory to address 04.

For the R7000 -

The jumpers use lines DB0 through DB7 at connector J17 on the logic board. The address is set by DB0 through DB4, DB5 is the transceive enable, and the baud rate is set by DB6 and DB7. The factory address is 08.

If you have any other rig, you can determine its address by hooking it up to your computer and changing the frequency or modulation mode manually. You will receive a group call packet that contains as its 4th byte the address of the rig.

Subject: TS440S Interface Information
[Via KA2UGQ]

A recent posting asked about the TS400 Interface.

I just came across the following which describes how to build one yourself and save big $$. I do not know the source of the article.

Mark C. DiVecchio 10435 Mountain Glen Terrace, San Diego, CA 92131
K3FWT Home of PC-VT and LPTx 619-549-4056
sdcsvax!man!wolf!markd Bulletin Board 619-549-3927

Kenwood Computer Interface Instructions

These Instructions are TS-440 specific, but the basics also apply to the TS-940, TS-811 and TS-711.

It is possible to save yourself a few dollars and lose nothing in quality by buying the parts to upgrade your Kenwood radio for computer control. Just purchase the parts were you find them and install them using the instructions in the Radio's Manual.

IC 54 is a uPD-8251-AC Serial Communications Interface.
Commonly called an 8251A ($1.89 Mail Order)
IC 55 is a TC-4040-BP 12 Stage CMOS Divider.
Commonly called a 4040 ($0.69 Mail Order)

The IC-10 Interface Kit from Kenwood Contains ONLY these two parts and less instructions than are in this file. The only thing you are going to miss, is the $22+ price tag on the IC-10 Kit.

Signals are TTL levels (NOT RS-232)
Baud rate is 4800 (1200 Opt.)
Format is ASCII Serial; 1 Start, 8 Data, 2 Stops

The Baud rate may be changed to 1200 Baud by removing jumper W50 and installing a jumper from the left pad to the center pad as viewed from the front of the radio. This will become obvious once you have the radio opened up. Many other Baud rates are possible, just look at the schematic.

As long as you are in the radio, lift D-60 to enable the 10 Hz. display. The main tuning knob is varing this digit, so you might as well see it. It also helps when using RIT/XIT as the RIT/XIT display does not resolve the 0.01 KHz. digit. This Modification is in the Radio's Book.

Not in the book is the fact that if you lift D-80 and do an MPU reset, you will be able to transmit on any frequency between 1.5 and 30.0 MHz. This means you will be able to work the Mars nets, Etc. Do not transmit out of band. It is illegal even if it is accidental.

Some computers use TTL levels on their serial ports. If so, here is a time when you will not have to convert it to RS-232.

The IF-232 Interface from Kenwood is a 1488 and a 1489 chip in a box. These are an RS-232 Quad Line Driver and Receiver and are available at Radio Shack for $1.29 Each. Here is an easy project that will save you a lot over the $69+ Kenwood price of the IF-232 Interface. The 1488 needs a + and - supply. Unregulated + and - 12vdc is just fine. Get the +5 vdc for the 1489 by putting a 7805 regulator on the +12 vdc supply. 100 ma. is about the max you'll draw, so the smallest transformer you can find will still be plenty large. Don't forget to series up two of each gate to cancel the inversion that the 1480's produce.

ACC-1 Connector — Use a 6 Pin DIN Connector. (Radio Shack $1.29)

Pin	Signal	Comments
1	Gnd	Signal Ground
2	TXD	Serial Data from Radio to Computer
3	RXD	Serial Data from Computer to Radio
4	CTS	Computer Ready; (Radio Input)
5	RTS	Radio Ready; (Radio Output)
6		No Connection

Pins 4 and 5 may be left Unconnected.

Subject: CAT Interface for Yaesu 727
Path: ..!JUNE.CS.WASHINGTON.EDU!bcn (Clifford Neuman @ The ARPA Internet)
[Via KA2UGQ]

I have seen many requests for information on this over the past year or so. At one of our local hamfests, Yaesu had a 1 sheet handout on how to use CAT on the 727. That handout follows. I have not tried this myself (yet). Note that the levels are not standard RS-232, but should be fairly easily converted.

The following information is from Yaesu. There are some errors picked up by KB7ABA which are noted in the approriate place. I have not yet tried using this. de N1DMM.

FT-727R CAT System Interfacing and Control

This information describes the hardware and software requirements of the CAT (Computer Aided Tranceiver) System in the FT-727R.

Connections

Four connections are used by the CAT SystemL three at the CAT jack, illustrated below, and one (Signal Ground) ar the outer contact of the MIC or EAR jack.

DO NOT SHORT THE OUTER CONTACT OF THE CAT JACK TO GROUND!!!

[Diagram of the CAT plug:

Looks like a stereo audio jack of the appropriate size.

The outer sleeve is +6 to +12 V DC (Battery Voltage) I do not think this line needs to be connected.

The middle contact is the Serial KeyCode Input.

The center contact is the Serial Meter Output (00h to 0Fh).

See the manual for further description.]

Data Format:

All serial data consists of single byte binary codes sent at 4800 baud, TTL levels, with two INVERTED stop bits and one INVERTED start bit.

Key Codes:

CAT Control consists of duplication the keystrokes that can be made on the tranceiver keypad by sending the corresponding keycodes to the Serial Keycode Input contact of the CAT jack. The most significant four bits (MSD) correspond with the key column and the least significant four bits (LSD) correspond with the key row. The Function key (on the side of the tranceiver) is simulated by setting bit 7. Results are identical to those described for manual operation in the FT-727R Operating Manual. Serial Meter Output is sent approximately every 100 ms while receiving.

[Table for the codes. The lines in [] are the original values in the Yaesu handout, and are followed by the corrected lines as determined by KB7ABA. Remove the lines in [] to see what sould be the right table.]

> GUNS DO NOT KILL PEOOPLE! *PEOPLE* KILL PEOPLE!

ndcvb!cartan!ndmath!nstar!w8grt!jim.grubs@iuvax.cs.indiana.edu (Jim Grubs)
sez:

With guns, most commonly....

> >If you don't see any difference between guns that kill and
> >radios that don't, then you yourself are part of the proof that guns MUST
> >be banned as soon as possible.
>
> "You can take my gun from me when you pry it from my cold, dead
> fingers!"

I rest my case....

Mr. Grubs, you are incorrect (again). The most common way for PEOPLE TO KILL PEOPLE is in an automobile and usually after they have been drinking. Since this forum is not one to discuss drunk driving or gun control, your message and this reply are not necessary to this net, nor are they desired by the majority as can be seen by recent postings asking that they stop. However, about the time it starts to die down a little, UP GOES THE FLAG with another Jim Grubs posting.

It is really hard to avoid an argument when what one says is referred to as "blithering lunacy". And then you go ON to add more fuel to the fire with obviously incorrect statements like the one you just made above.

Can't you just let it go? Please?

O.K. Let's look at this problem, then: out here, NEDA has a large network of NET/ROM (actually, TheNet) systems which works moderately well, but even the guys who founded it admit that it's a temporary hack and it SHOULD be replaced by IP. (And these guys are operating on heresay; they're not IPers at this time).

So, at a networking meeting (over pizza, naturally :-)) it came up that the entire network should be converted to IP. The problem is that doing so would alienate probably three-quarters of the users of the network.

Now, it doesn't seem fair to say "tough" to the end-users, and it

doesn't seem reasonable to say to them "if you want to use the network,
you have to go through an AX.25<->TCPIP gateway (like GRI or RGV)".
At the same time, when it comes down to it, I don't think we have the
resources out here to build two parallel networks (one TheNet,
one IP). (I've tried the NOS stuff to route IP through net/rom,
seems rather kludgey to me [no offense, I'm not being critical here,
it just seems like a hack of a theoretical idea]).

I'm the FIRST guy to say [CENSORED] 'em if they want to keep their
C64's and CP/M Shoeboxes forever ... but now, I'm thinking in terms
of my own interests and what will get IP less of a "clique".

73's Chris

Has anyone tried out the new AOR AR-1000 portable scanner?

This a 1000 channel handheld that covers all the standard PSB
frequencies as well the 800 Mhz band. It has 40 chan/sec scan
capability. It was advertised in the RSGB "Radio Communications"
magazine under both the AOR designation and private labeled
under the "Nevada" name.

Locating 'telnet' in the TNC isn't the right approach. I see no reason why your local tcp/ip network node can't support a telnet server for AX.25 connections. With such, joe-dumb-terminal-ham would connect to the node, as he does now with net/rom, and request a connection to a distant node, as he does now with net/rom, and get a nice reliable high-speed network connection to the other end, as he occasionally does now with net/rom. He can even do uploads and downloads, using whatever error-full protocol he currently uses, since telnet can be completely transparent if desired. In other words, for him, there's no difference!

But the tcp/ip network will let the advanced packet operator/researcher do much much much more, since such a person can generate the IP packet for whatever he is doing (telnet, ftp, smtp, snmp, digital voice, weber pictures, etc. etc.) in his shack computer and send it into the network through the very same network node.

Thus this kind of configuration is a complete win for all concerned. I think the improved performance of the resulting network will sell many people on upgrading from dumb-terminal status to sophisticated ham computer user - which they can't do with the existing net/rom network.

There will, of course, always be many who don't upgrade - those who seem to think that the box they bought is good enough, or else it wouldn't be sold. They're the same people who refuse to install an $11 mod that would incredibly improve their TNC's performance. If they can use the network, they're happy.

For the average user of a ham network, whether it runs tcp/ip or net/rom (or even ROSE, ecch) isn't important. For the advanced user, tcp/ip offers the most flexible networking environment currently available.

Does anybody have a direct QSL route for UJ8JCQ? It's taken me a while to finally dig out a Tadzik contact, and I just can't stand the thought of sending this one to Box 88. Any help would be appreciated.

This past weekend I worked V31UK who had come over from the mainland to Jim's QTH and was operating from V31BB's station. I listened to several of his QSOs and he discussed his own QSL habits and problems. He also talked about Jim's QSLing. He claims Jim has difficulty in keeping up with his QSLing. Apparently V31BB is very active and, judging from David's discussions, does QSL, albeit slowly.

I cannot speak for V31BB and my opinion on his operating practices (low) has not changed. However, it appears that his intention to QSL is to do so.

Having been involved in chasing DX for a number of years, I have learned not to become too anxious for QSL cards to appear in my mailbox. I sometimes wait months before sending out cards and have found that some expected cards never arrive, but many arrive months or even years after a contact. It is not uncommon not to receive a QSL from a station. It is frustrating when you need a country confirmed. However, when looking back through my log, there are many unconfirmed contacts that, at the time of the contact, seemed like a sure thing. Usually, the only sure thing for receiving a QSL is from a bona fide DXpedition or a contact with a Soviet ham, with the exception of the only Albanian contact I have had.

Belize is not a "rare one" and if you really need it, just keep tuning the dial; it will show up (if this is true, why do I still need Albania and Kaliningrad?, hi, hi). You don't need to work V31BB to get a contact.

I am building a controller for my club's Repeater/Remote-Base. I know, hams aren't suppose to be into building things anymore... What we don't want to build are the remote controlled radios. We've looked at the ICOM 900 series radios and the Kenwood radios. The Kenwood radios interface through the mic connector on one or two leads, the ICOM is a stack of pins!

The problem is that Kenwood is being real tight lipped about the protocols used between there control heads and the radios. I even offered to sign a non-disclosure agreement. They just aren't interested.

Before I spend the money on a control head I'll never use and weeks of time spoofing the protocol myself, I'd like to find out if there is someone out there in Usenet land that's already done it and is willing to share.

Any help or pointers would be greatly appreciated.

Yes, I know one is not supposed to issue spelling flames. However....

Let me briefly point out that an article containing misspelled words and poor grammar has much less impact than one that does not.

This is because, to the reader who notices the flaws, the article with poor grammar or misspelled words reflects a lack of orderly thought on the part of the poster. Thus the reader naturally questions the validity of the poster's ideas and information: "If he can't spell it or turn out an understandable sentence, why should I believe whatever it is he's trying to say?"

And that brings up another point: sometimes the text is so garbled as to obscure or completely mask the poster's meaning. You and I have seen articles on here that were completely undecipherable because the poster's thoughts were completely obscured behind his inability to express them.

Allowance, of course, must be made for those for whom English is not their native language. But those articles are rarely a problem since the posters of those articles usually take extra care to ensure the understandability of what they've said. What is so saddening is that there seem to be people posting here who are computer-literate but otherwise barely able to write their native language.

So please, to ensure that your postings have the greatest possible value to the readers of this group, take just a moment to check for typographical errors, to look up the spelling of words you aren't sure of, and most of all, to read what you have said over just one more time to make sure that it really says what you want it to say.

We will all thank you.

Let me risk being labeled a heretic and play devil's advocate for a moment. What I see implied above is a bit of "Let's fix something that's not broke". When one transitions from experimenter (The tcp/ip community) to service provider (BBS, node, digi owner - anyone who grabs a chunk of a public resource and offers a service to the community.), he should pay particular attention to the user community and their needs (Brian Kantor will debate this point but nontheless :-).

Let's look at some realities. The first is that in general, 1200 bps L/WANs are going to de de rigeur for quite some time to come. Sure we mentally and verbally masterbate about faster modems but the combination of many factors, not the least of which is all the commercial vendors racing headlong toward proprietary protocols, conspire to make 1200 baud, in some few cases, 2400, the lowest common denominator.

Given that reality, one must admit to the next one - IP at 1200 baud sucks. Especially in a properly engineered RF environment (full duplex, no digipeaters) ordinary AX.25 beats the pants off of IP for what most users use packet for - mainly keyboard chatting and BBS browsing. It is neither our duty nor our right to tell a user that his particular form of packet enjoyment, say, keyboarding, is improper. Our duty as service providers is to provide the facilities our users want and introduce new technology wherever and whenever it is appropriate. A TheNet network talking to chat hubs such as Packet Cluster or the like provides just what most ham users want.

Even for file transfers, I've found it faster to take a binary and uuencode it, put it on my BBS as a message and let it forward to my recipient than to attempt an FTP of the same file. And remember that this is on a properly engineered RF network.

In terms of an average non-computer-professional user, the combination of poor performance, buggy code, "Read the f*cking source code" for documentation, a poor user interface and a generally elitist attitude among some of the experienced users and implementors pretty much eliminates IP from consideration. (We all know that these problems are not unique to Phil's package but it is the point of discussion at the moment.)

It is sometimes hard for us bleary-eyed hackers that many hams have no interest in the gee-whiz aspect of packet and simply want to use it as a tool to facilitate other aspects of the hobby. This is most emphatically NOT the "appliance operator" syndrome. The DX packet cluster network here in Georgia is an example. This is a network of "chat hubs" that link to each other and provide a large roundtable environment as well as messaging and several other features of particular interest to DX ops. The network is implemented with a commercial package written by someone at DEC (and yes, it is just as buggy as the PD stuff but you have to pay money for it and you don't get source.) It comes with nice user docs and can be configured by a non-hacker. This network was built independently of the state packet group, GRAPES, mainly I think, because the DXers felt that we are too experimentally oriented for their needs.

Your typical user on this network is a serious DX operator. He has bought a computer, TNC and radio and dedicated it to cluster operation. He nails up a link to the nearest hub and leaves it there more or less forever. That's as far as his interest goes. He'd never know the difference between an MTU and AXHANG much less care.   In short, he is a USER. I'm personally quite gratified to see this purely end-user application develop even if it did happen outside of the normal channels.

I've strayed quite a bit from your immediate question and I know I've gored quite a few sacred oxes (let the bellowing begin!). The theme is simply, find out what your users want and then try to provide them with that service. I've found that users are usually at least aware of some aspects of the state of the art and will accept the change necessary to enjoy new stuff just as soon as there is some likelyhood that more time can be spent using as opposed to debugging the technology.

We have the same situation as in the commercial world. There is a place for basic research (IP, 56kbps, ethernet-over-{microwave,laser,carrier pigeon}, and the like). Then there is applied development where the product of basic research is "productized" and delivered to the user body (consumer). Both are essential, equally important and almost never mix well together. It is important to realize the distinction and then to realize what it is you are providing. If you are nailing up digis, nodes, bbs's, servers and the like, you are a service provider. If on the other hand, you put up an experimental network using gnats as carriers and tell everyone that they are welcome to participate whenever and however the system works, you engaged in research.

So find out what your users want and proceed accordingly.

73 John

To all you people who do not want guns: Isn't it interesting that one
of the first things Mr. Gorbachev did when Lithuania seceeded was to
confiscate all of the weapons from the Lithuanian citizenry. Maybe he
did not want them able to withstand the red army....

The lesson that I take from this is that an armed citizenry keeps a
tyrant at bay through the fear of an armed uprising.

Yes, I too am appalled at the violence in our cities (especially
Boston lately), but the responsible use of guns is a very strong
deterrant to tyranny as well.

I am not in the NRA. I do not have a gun, and probably never will in
my own home. But I am sympathetic with what they are saying....

Where there is a will, there is a way....

I got my novice and tech licences a couple weeks ago and have been enjoying myself greatly on the 10m HF band. I've had some real surprises in the past couple days while operating at the ham radio club station (W6YX).

I've been aiming the beam antenna out over the Pacific Ocean to try making contacts overseas in that direction. Several times, I've been aimed toward Hawaii or Japan and called CQ, and had a ham in Alabama, Mississippi, Tennessee, etc answer it. After I lock it in, I'll rotate the antenna around to face that way. If they're talking while I rotate it, I'll notice I have, typically a 5 by 0 signal from them, then as it rotates north it fades and gets noisy, then as it swings toward them, the signal jumps up to a 5 by 8. That's happened a number of times. Also I once was aimed at Hawaii calling CQ and someone in the United Kingdom answered, but I wasn't able to lock him in. Again behind my antenna.

After I've been back for a while and thought about it, it sounds like I was transmitting out west and the signal was going around the planet and reaching someone to the east, and vice versa when I received! This is really strange as I never thought long path propagation would be possible on 10 meters since it is a daytime band, and to do long path the signal has to cross all the way across the dark side of the earth. But it seems to have been happening. Has anyone else noticed this on 10m?

Oh, I also made my first overseas contacts today. ZK2KY in Niue, an island in the South Pacific, and VK2CX in Nelson Bay, Australia. Looking forward to more fun!

My only reply to this is....

STOP!   STOP!   STOP!

STOP THIS BARRAGE OF STUPIDITY NOW! WHY MUST THIS NEWS GROUP BE INUNDATED WITH THESE PEDANTIC RANTINGS? IF ITS NOT 220 MHZ, NOT CW TESTING THEN ITS, OF ALL THINGS, GUNS.

ENOUGH.

IF YOU FEEL SO STRONGLY, GET THE INET ADDRESSES OF OTHERS WHO ARE INTERESTED AND CARRY THIS ON YOURSELVES.

Thank you. I'll now revert to my normal, quite, understanding self.

Bob, N5GNA

Why is it necessary to have repeaters with so much power?

I can see it if it is a repeater with a wide area of remote receivers.

But if it is a repeater with a common antenna for transmit and receive, then 250 watt transmit will make it heard wider than it can be hit from the average 25 to 50 watt mobile station.

In article <635.26279072@weyr.FIDONET.ORG>, katz@weyr.FIDONET.ORG (sylvan katz) writes:

> I have a TS930s with antennae tuner. Lately, as I am sending cw I have noticed that the ALC starts to drift lower so I turn up the carrier and it keeps drifting down until I lose that ALC. Can anyone give me any suggestions as what to look for or do? PS: I have never had to turn the carrier up to maximum. Sooner or later I fid a point usually a little over half way where the length of the QSO is less than the drift. Also, if I do not key the transceiver for a while the ALC is up to high and I have to tur

n
>

You didn't mention how old your 930 is, but I suspect it's probably got a serial number something like 32xxxxx or lower (the first two numbers are the important ones here). Anyway, there was a problem with the early 930's with ALC drift, caused by flexure of the PA printed circuit board. Sounds weird, but true. As the PA board heats up with long transmissions, particularly on CW, the board flexes and the rivets which are used on the board to provide ground feedthroughs from one side to the other don't always make real good contact with both sides of the board. When the board cools down, it flattens out and the problem goes away, until the next time you transmit. Under certain conditions of hot board and high RF currents on the board grounds, it may not be possible to get full power out of the PA.

The fix is: CAREFULLY remove the PA assembly from the radio (not fun), and EVEN MORE CAREFULLY remove the PA board from its heatsink. Be sure to observe that under certain of the transistors which are bolted to the 'sink are some insulating pads- very important to get them back in the right places, or ZAP! when you turn it on. With the board in your hand, observe that there are a number of locations (maybe as many as 20- I don't precisely remember, last time I fixed one was in '84) where there are small rivets going through the board to tie the grounds together. Some of these places include the areas around the Emitters of the Final Transistors (the MRF422's) and around the Emitters of the Drivers. Solder each of these points, making sure that the solder REALLY FLOWS at each joint of a rivet and the board. Don't be afraid to get the board good and hot- you want all that green coating around the joint to fall off so you can get a good solder connection. Make sure you do this at all such areas, also reheat any suspicious-looking joints around the rest of the PA board. After you do this, you can put it back together- use heatsink grease under each device, including the Finals. Screw the devices securely back down to the heatsink, and re-install the assembly in the radio. This should have cured the ALC drift problem.

WARNING: If you are not comfortable with this work, DON'T ATTEMPT IT! You can, if not careful and somewhat skillful, really F**K up the radio! Also, Kenwood Service has a Service Bulletin on this problem, which may provide more detail on the locations of the feedthroughs and other important stuff I may have forgotten. I'd suggest contacting them at least for the bulletin and maybe for a quote on them doing the job- they may have a flat charge for this, the added benefit being they will also do the other standard service updates to the unit for no additional charge (there are a lot of things that got updated in the early 930's).

I used to be Sales/Service Manager for Texas Towers and did a lot of out of warranty work on Kenwood Equipment, that's how I know about this fix- also, I had one of the first 930's in the States, in addition to the one I currently own (bought well after they had fixed all the early production problems).

Hope this has helped.   Dave KD5RO/2

The steel wool route probably works, but Radiokit sells ferrite beads to fit both RG-58 and RG-8 sized coax. These work like a champ and would look better. The address is:

Sorry, but what is probably happening is your beam ant. is not truly uni-directional. Some of the directors will be acting as reflectors and vice versa.

I too have had some ideas on using to remote support offered via the mic connector, but at high price for the RC-10 controller, this project has languished. I would like to interface a separate UHF receiver/transmitter to my TM-321 (220Mhz.) so as to operate cross-band (like the new crop of dual-banders) in full duplex. All this to be done out of the car to enhance my fringe area coverage via my UHF walkie.

So if you have any info, please pass it along, Email or Usenet.

I would say that in 250 watts may get you 100 to the base of the antenna after losses from duplexer, long feed line, and having less than the rated output. 250 maybe when operating at full input power and using 13.8 volts. Our system users a 120 watt Mirage repeater amp, running 73 watts output to the duplexer, 55 watts out of the duplexer through 50 feet of 1/2" hardline. Our receiver is .18 microvolts for 12 Db Sinad, .24 through the duplexer. This combination is fairly balanced when using a 25-30 watt mobile transceiver with a 3 DB gain antenna. But when using a portable, we tend to get into the repeater receiver better than hearing it. Due to ignition pulse noise, man-made noise, rubber antennas and inside car operation, we could benefit from more power to fill in the marginal areas. We do have one satellite receiver and one remote receiver to help the portables along.

If you have a clear repeater channel (a seldom enjoyed luxuary in Sandy Eggo now adays) then the more power the better. Same in mobile operation. I seldom run "low power" in the car (unless operating Simplex) as I want a full quieting signal into the repeater as much as possible. It's inconsiderate and irritating to repeat white noise for all other listeners to hear.

Barry and I know each other quite well and I think his obvious (to me) tongue in cheek was missed. The computer used was a Cray-2. It has 256 megawords of 64 bit memory and four processors running in parallel. The Cray Research Corp has done a good job of achieving reasonable parallel performance with little in the way of hardware support for it. The Cray was used as a software demodulator running the `optimal' FSK demod. This is

bandpass filter, hard limiter, bandpass filter, discriminator of your favorite variety. I chose filter/slicer (its simple). I chose not to do the clock recovery on the Cray and let the Crayette (KA9Q's little grey cells) do the clock recovery and NRZI decoding.

>John Kirby

=====

Follow-up....
---------------------------
```

I have not tried a Visitel on the radio but I have serious doubts that it could ever work. The details of the transmission format are a little fuzzy in my brain but here is what I recall.

The image starts with a digital header containing synchronization signals and information about the image size. After this there is NO horizontal sync as in most ham SSTV formats.

The picture is composed of 96 x 96 pixels of 32 gray levels.
The pixel rate and audio carrier frequency are both 3579545/2048 per second. Gray levels are conveyed by a combination of phase and amplitude modulation. 2 phases (180 degrees apart) and 16 amplitudes.
Each pixel is one audio cycle.

This is fine for a phone line or FM radio. Let's perform a thought experiment about what would happen on SSB ...

Suppose your tuning was off by 20 Hz. The receiving end expects one pixel per audio cycle and would gather the pixels at 1727 or 1767 per second while the sender is producing them at 1747 per second.
The phasing would be all messed up. AGC and QSB would also mess up the amplitude modulation of the audio carrier.

Several people have proposed using the Visitel for HF SSTV but I have never heard of any success. I would be very interested in hearing more about people's experiences with it.

If you would like to try SSTV at a low cost use your home computer.

* AEA has an interface for the Amiga for about $300.

* SPEC-COM has SSTV software for the Radio Shack COCO. I think it was about $40.

* A color SSTV program for the Atari ST is available from several user groups. It requires a simple interface that can be built for about $7. See 73, December 89 and January 90.

* I have a vague recollection of a product for the IBM PC from a company named something like Computer Systems Consulting. But it was only black & white. You don't see too many B&W pictures anymore.

In summary,

- The Visitel is not compatible with any of the ham SSTV modes.
- The Visitel modulation scheme can't be decoded by the usual Frequency to Voltage demodulators.
- I seriously doubt the Visitel would work over an SSB radio. (Please, someone - prove that I'm wrong!)

Color SSTV can be very expensive but it doesn't have to be anymore.

If you must have 262,144 colors, spend $1295 on a Robot 1200C. If you want to make only a small investment to try something new, use one of the systems based on a home computer.

I don't know what the problem is with Kenwood USA. I was in need of the same information awhile back and got the same response from the USA office. After searching around and asking many people I finally came across a fellow in Ga. that was able to get the information faxed to him from Japan. They were more than happy to give it to him. They sent the information the next day no less. I was able to get a copy from him but have not been able to implement it yet.

I would suggest contacting Kenwood Japan.

I am attempting to build a low power fm transmitter. The circuit calls for NPO ceramic caps, however these little buggers are quite difficult to locate. The local radio shop suggested that I substitute silver-mica, however I have been told that silver micas 'fail' at much over 50MHz. The circuit in question will run 88Mhz (part 15) and then be adapted to 144MHz (ham band).

Any ideas on where to locate NPO's are what to use as a substitute??

BTW - the values are 330pF, 0.1uF, 0.001uF

Thanks in advance es 73's

Jim- NPO ceramic capacitors are generally used in a circuit because of their retention of a fairly constant capacitance over temperature, NOT because they are particularly better-suited at VHF than other types. (that came out a little more confused-sounding than I thought it would, but I think you get the picture). Silver Mica capacitors work EXTREMELY WELL at the lower to middle VHF frequencies. The only real warning is that the breakdown voltage ratings of these capacitors can be more easily exceeded at VHF than maybe some other types of caps, but their value is stable and their self-resonant frequency is generally high.

Typically, you'd use an NPO ceramic in a frequency-determining circuit (such as an oscillator) or other circuit where the caps' characteristics need to be stable over temperature. However, there are other types of temp-compensating caps (N470, N750 to name two) which are also popular, but have very different temperature coefficients. Their drift (characterized by type) can be used to stabilize an oscillator which is drifting in the opposite direction.

If the circuit in question is not an oscillator, or something equally critical, then probably almost any ceramic cap or silver mica will work fine.

I hope this helps and doesn't confuse you more.

I am wondering if any of the microwave fans out in netland can provide me with info, references, etc. on any use of the spectrum 100 GHz and up. Do such frequencies require methods that are very different from 24 GHz systems?

73,

I have noticed several recent postings on the computer interfaces to YAESU and ICOM equipment, and was wondering if someone will also post the information for KENWOOD.

Also, would anyone be able to critique the pros and cons of any or all of these interfaces.

Thanks

John Anderson N5OPY

In article <1990Apr21.060104.20254@lopez.UUCP> arf@lopez.UUCP (Jack Schmidling) writes:
> However, I will take this opportunty to help you understand
> why I consider about 95% of hams, "MUSHBRAINS".

Well, I see you're into digging your own grave. That's useful.

> Most of us can do that with a power meter and SWR bridge.

Which might test your LO, but not much else. You won't learn anything about band conditions that way. Of course, it wouldn't bother us if your BROADCASTING was done into a dummy load (a fitting term)...

> ARF: A real crushing flood of feedback, huh?

You should have seen my mailbox after my previous posting.

> ARF: The kind that gets all glassy-eyed when asked anything
> more controversial than "how's my smoke?"

Ham radio is supposed to be apolitical and noncontroversial. That's tradition, the law, and common sense. Amateur Radio is an international political football, and some of us havn't forgotten the recordings that anti - ham administrations played of operations like ARF during WARC '79.

> ARF: Congrats Bob, however there is more to hamming than
> just what your particular narrow interest happens to be.

A cube of sugar in a vat of sulfuric acid.

> You do your thing, I do mine. That's what is supposed to
> make it fun, not a source of conflict.

This is the sort of moral philosophy that fundamentally wrong. It pretends
that "our things" won't conflict. Moreover, it equalizes all actions,
eliminating the concept of right and wrong, or any gradiation between.
"I'm okay, you're okay". Yeah, riiiight.

> ARF: The major deterent to Oscar use is money not IQ and anyone
> who has done it knows that.

I've built OSCAR stations for less than the cost of an HF rig. They don't
have all the bells and whistles like autotracking and automatic Doppler,
but that just means that the op has to have a little upstairs. With the
advent of the pacsats, one can get involved for under $100.

> I lost interest for the same
> reason I lost interest in ham radio in general, its just
> plain boring.

So you've decided to spice things up by becoming the Geraldo of 80m???

> On the Amateur Radio Forum, one can engage his brain in a
> debate on any topic (except ham crap) and hang in there till
> the sun comes up.

ARF is not debate. It's one - sided tabloid hucksterism. Debate is a
structured, BALANCED discussion of relevant issues. Debaters take well
reasoned, persuasive positions, granting arguments when proven wrong.
Debaters do not indulge in personal attacks, unless so attacked. The
junior and senior high school kids that I coach and judge in debate abide
by those rules.

> If you find that a poor use of ham
> spectrum, then I am afraid I find your kind, a poor use of
> human tissue.

Nice try. I know ninth - grade ghetto kids who throw better insults.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

I am appealing to the net to help me determine the identity of an object several of which were found at the scene of a crime (No Joke!). I suspect that the object is related to a scientific or engineering application hence the appeal to these groups.

The object is a cylinder of glazed white ceramic with a diameter and a length both 7/16 of an inch.

If you have any idea of the applications or origin of such an object please e-mail me directly as this information may be valuable in tracking down the perpetrators. Thankyou very much in advance for any assistance you can offer.

My appeal for information regarding the possible identity of a ceramic object connected with a crime has yielded a great deal of response already but so far no success. The suggestions that have already been mailed suggest certain clarifications are needed.

The object is a "solid" cylinder of glazed (or perhaps polished) white ceramic with a diameter and a length both 7/16 of an inch. There are no markings on the object and no holes of any sort or any obvious means for mounting. All the surfaces have a similar smooth texture while the two edges are slightly and smoothly rounded. (All in all it bears a striking resemblance to a mini-marshmallow of the sort one puts in hot chocolate.)

One respondent asked whether or not the object is magnetic. It is not. It is certainly not a ferrite and in my best estimation is a ceramic closely resembling that used in electrical standoffs. Several respondents suggested that it is a standoff but the lack of any means for mounting it or anything to it seems to preclude this.

Lastly, these objects were used as projectiles. Is it possible that these represent some standard ammunition for a gun of a sort that I have never encountered before?

Again, if you have any idea of the applications or origin of such an object

please e-mail me directly as this information may be valuable in
tracking down the perpetrators. Thankyou very much in advance for
any assistance you can offer.

What's the possibility of hacking the TNC code to refuse connections from
another node that has its window size at other than 1 when its own is set
to 1?

The ability for almost all the radios on the market to detect a low-battery condition is terribly inadequate.

Not only should they be able to tell you when the battery is low by both visual and/or audible means (user settable), but there should also be a "mode" whereby the voltage is shown on the display. How hard would it be to get 1/2 volt accuracy (which is about all you need in this situation, if that) anyway?

If it comes as a plug option, then I'd also want better accuracy (1/20 volt) and a current meter, too.

I have recently developed an interest in weather satellite reception and have been reading everything I can on the subject, including the info that gets posted here from time to time.

I ran across some information that I have never seen posted before, so I thought I would share it with all the others out there that are enthused about image reception.

It seems that you don't need as much equipment as you might imagine to receive images from the GOES geosynchronous birds. These satellites send a lot of data back to Earth, but most people are messing with the WEFAX stuff, but even then you are looking at a downconverter and various other stuff that I won't go into detail on here.

Anyway... what I found out was that there is a REBROADCAST of these signals on TVRO satellite Spacenet-3 Transponder 17. What you need to do is grab the baseband video out of the TVRO receiver and run it over to your general coverage HF rig. Tune the HF rig for the following freqs:

1.9315 MHz GOES EAST
1.8840 MHz GOES WEST
1.5720 Mhz Weather Charts

This rebroadcast seems to be in an HF WEFAX format with 120 LPM and what appears to be an IOC that also agrees with HF. I used my scan converter with AM detection and had best results receiving the signals with the HF receiver in FM mode. I still have not really deduced just what IS the best way to receive this stuff... but that is mainly because I really have no expertise yet and am just hacking at it. Be that as it may, I DID get pictures. I would say that I don't have enough IF bandwidth and that may be preventing really GREAT picture reception... but it does work!

So if you are into weather satellites and happen to have a TVRO system, this is definitely worth investigating! If anyone has the real details on this rebroadcast, I sure would like to hear from you.

ARRL Letter - Volume 9, Number 7 - April 9, 1990 - Part 1 of 3

ARRL TO FCC -- W1AW OPERATIONS NOT PART OF THE DISPUTE

On October 11, 1989, FCC Special Services Division Chief Robert H. McNamara wrote to a number of amateurs seeking comments and information on phone patches, information bulletins and over- the-air telegraphy practice. The letter requested information and insight that could bring a resolution to "the unfortunate continuing over-the-air dispute that takes place on the 20 meter band...which is jeopardizing international goodwill..." The letter asked a number of questions on these topics.

ARRL's response was submitted on November 15, by Counsel Chris Imlay, N3AKD, in behalf of W1AW Trustee, John Lindholm as well as the ARRL. In it, Imlay made observations and recommendations as requested in NcNamara's letter. At the urging of FCC staff, the League in the mid-1970s developed the eleven-point "Phone Patch and Autopatch Guidelines" that appears in The FCC Rule Book (Eighth Edition) at page 13-15. These guidelines have stood the test of time, and are generally accepted as a useful supplement to the Commission's Rules.

The League believes that the definition of the term "information bulletin" contained in the Commission's Rules should be strictly applied and enforced.

With regard to telegraphy practice, the only guidelines needed are to ensure that the purpose of the transmissions is to provide telegraphy practice and not to engage in one-way transmissions that otherwise would be illegal:

- The text should not be randomly generated, since such practice material is readily available via other media.

- The text should be taken from a published, readily available source to facilitate checking accuracy of copy.

- The text should relate in some way to Amateur Radio.

- The text should not be sent repeatedly.

In a letter dated December 21, 1989, McNamara stated that 45 replies were received in response to his letter and that although the responses "contained somewhat conflicting information and views, they were helpful in understanding the issues so that a course of action could be selected." McNamara stated that it appeared that the intensity of the debate has subsided and that most of those participating in it have recommitted themselves to the basic principles of the amateur service by attempting to resolve such disputes off the air.

He stated that the disputes are centered in three main areas: phone patch communications on the HF bands, information bulletins and telegraphy practice transmissions. McNamara stated that the replies "...confirm that misuse of an important amateur service frequency band was having a major negative impact upon the service. They clearly show that the amateur service was not fully cooperating in selecting transmitting channels and in making the most effective use of the amateur service frequencies as required by Section 97.101(b)."

McNamara stated there were two general views for a solution in the responses. One, that the amateur community should be allowed to solve the problem internally. The second that the Commission should mount a massive enforcement effort. McNamara said the second approach was not possible due to enforcement priorities and budget constraints; if direct Commission intervention proved to be necessary it would be in the form of additional restrictions that may affect all amateur operators. Mr McNamara said "In view of the above, we will afford the amateur community the self-regulation opportunity suggested. To implement this plan, we suggest you and the managers of eight other amateur service organizations.. consider submitting a joint plan for the problem resolution within the amateur community." McNamara suggested that this plan be developed by July 1, 1990.

In a March 19 letter to the FCC, the ARRL stated that, according to letters received by the FCC in this matter, there is no basis for the operations of W1AW to be included in any further discussion. Letters received by the FCC from amateurs indicated that the amateur community clearly hold the W1AW transmissions of code practice and bulletins in the highest regard. There was not a single dissenting statement to be found in the file and thus no purpose to be served by having W1AW operations included in further discussions aimed at resolving the dispute on 20 meters.

As one correspondent put it, "...regarding the telegraphy practice...[and] W1AW...I have a hard time understanding that it is a problem." The ARRL agrees and stated that it does not believe that the W1AW trustee should be a party to the FCC requirement that those involved submit a plan of resolution.

The League did not discount the seriousness of the central issues of the dispute, nor the harm to the Amateur Radio Service and to the public which has resulted from the continuing on-the- air confrontations between amateurs holding differing views. Thus, the ARRL's letter of November 15, 1989, which contains a number of specific suggestions in this regard, was sent to the FCC.

ARRL Letter - Volume 9, Number 7 - April 9, 1990 - Part 2 of 3

ARRL FILES REPLY COMMENTS IN GENERAL DOCKET 89-554

On March 16, the ARRL submitted its reply comments to the FCC's inquiry relative to its preparation for WARC-92. In it the League said that it was gratified to note the absence of comments proposing the reallocation of existing Amateur Radio bands to other services. ARRL noted that a number of commenters representing high-frequency broadcasting (HFBC) interests appear to be seeking expansion of their allocations by about 50%. ARRL said that this additional spectrum might not be needed if the HFBC service adopted single-sideband instead of double-sideband amplitude modulation as its standard and that FCC should consider expansion of HFBC only after it had embraced this and other spectrum conversation techniques.

The League noted that Motorola's forecast for 800 MHz of new spectrum for land mobile in the 1-3 GHz range was "jolting" if not unsurprising. ARRL suggested that some portions of the UHF TV spectrum be considered for reallocation. The increased use of cable, videotape and other spectrum conservation techniques has, in the League's opinion, lessened the need for some of the television spectrum allocations in the UHF region. ARRL agreed with comments made by the American Petroleum Institute which said that while there is a shortage of land mobile spectrum... the situation is aggravated by the operational and technical inefficiencies in use in their current spectrum assignments.

ARRL EXECUTIVE COMMITTEE MEETS

The Executive Committee (EC) of the American Radio Relay League met on March 10 in Washington, DC. Among EC actions were:

- Authorization to file comments in PR Docket Numbers 89-599 and 89-552 regarding the establishment of a Personal Emergency Locator Transmitter Service in the 220-222 MHz band and implementation of the 220-222 MHz land mobile allocation into Part 90 of the FCC rules respectively.

- Appointment of a special working group to evaluate the FCC NPRM in PR Docket 90-55 against the ARRL petition for a codeless class of amateur license, RM-6995 with the objective of developing a strawman ARRL position for distribution to the Board before the next Executive Committee meeting.

- Moved to request a 30-day extension for the filing of reply comments on RM-7248, the League's petition to establish limited segments for automatic control of digital HF transmissions.

The Executive Committee also reviewed the status of a number of ongoing FCC, international and organizational matters as well as ARRL and IARU preparations for WARC-92. The full text of the Minutes will appear in the May issue of QST.

ARRL FILES COMMENTS IN PR DOCKET 89-599

On March 20, the ARRL filed its comments with the FCC in its proposal to establish a Personal Emergency Locating Transmitter Service (PELTS) in the 220-MHz band. The ARRL said this proposal is premature because the FCC's proceeding in PR Docket 87-14 to reallocate the 220-222 MHz band from the amateur to the land mobile service is not final. The League noted that should the FCC's decision to reallocate the 220-222 MHz band be ultimately reversed there will be no frequency allocation for the private land mobile radio service and that no further action should be taken in this proceeding until the Commissions's allocations orders are affirmed on appeal, and any and all judicial appeals are exhausted.

ARRL Letter - Volume 9, Number 7 - April 9, 1990 - Part 3 of 3

STS-35 MISSION APPROACHING LAUNCH

Ron Parise, WA4SIR, is a Payload Specialist on the Space Shuttle mission STS-35 scheduled to be launched May 9, 1990 from Cape Canaveral. The ARRL Educational Activities Department now has a SAREX teacher's package which includes lesson plans, resource material, informational videotapes and more. You can obtain the package by sending a 10-13-inch envelope with $1.25 postage affixed to EAD at ARRL HQ.

Ron will operate both 2-meter AFSK packet as well as 2-meter FM voice. The packet station (an HK-21 "pocket-packet TNC" marketed by Heathkit) will transmit bulletins providing updates on the mission and will operate in a ROBOT mode where stations on the ground can connect to the shuttle TNC and obtain a QSO number to validate the contact.

Ron is scheduled to operate the 2-meter voice station during his off hours and he will spend the majority of his time talking with school classrooms around the world offering them the opportunity to talk directly with an astronaut aboard the Space Shuttle. NASA has authorized SAREX in order to "encourage youth to become excited about science and technology" and to publicize manned space flight to the general public.

This past week the amateur equipment to be used on the mission underwent EMC (electromagnetic compatibility) tests. These tests are designed to determine the possibility of any interference the amateur equipment may inflict on any of the shuttle electronic systems. NASA has notified AMSAT that all the equipment passed the tests.

With SAREX on STS-35, Amateur Radio may have an opportunity to further the quest for international cooperation in space. Now that Amateur Radio activity on the MIR space station appears to have resumed, AMSAT and ARRL are investigating whether there will be a mutual-visibility window between STS-35 and MIR for a first- ever Shuttle to MIR linkup. Adding to the excitement, the STS-35 Mission Commander is Vance Brand, who participated in the the Apollo/Soyuz program many years ago. Stay tuned to AMSAT and ARRL bulletins as further details become available.

INTERNATIONAL MARCONI DAY

Under the sponsorship of the Cornish Radio Amateur Club, "International Marconi Day" will be held on Saturday, April 21 1990, (0000-2400 UTC).

During this event, approximately 14 stations in 8 countries will be active in the General class portion of 6 HF bands. Each station will represent a location of historical importance in the life of Guglielmo Marconi, a pioneer of transatlantic communication.

All amateurs are invited to participate in this annual event, first held in 1978. A special award designed around a 1912 Marconi Company Wireless stock certificate is available to all stations confirming contacts with 10 or more of the special event stations. To receive the certificate send a copy of the logs and 10 IRCs or $5.00 US to Cornish Radio Amateur Club, Box 100, Truro, Cornwall, TX1 1RX, United Kingdom.

SA-AMSAT BACAR MISSION 90/1 SUCCESSFUL

On March 10, SA-AMSAT launched three balloons carrying Amateur Radio (BACAR) to a height of nearly 50,000 feet above sea level.

BACAR was equipped with an RTTY telemetry unit providing information such as current altitude and rate of climb. The telemetry transmitter's output was in the 2-meter band. Also aboard was a monochrome CCD camera feeding a video transmitter operating on local UHF TV broadcast channel 35 (583.25 MHz). The South African licensing authority was petitioned by SA-AMSAT to use the commercial television frequency so that youth groups and young amateurs without amateur equipment could participate.

The local weather bureau provided tracking support and other logistical assistance. Seconds after BACAR started to ascend, reports of good quality video were received. Later in the flight video reception was reported from as far as Pietersburg, South Africa, a city over 300 kilometers from the launch site.

RTTY DX Notes for Weekending 20th April 1990.
Part 1 of 3.
BID: $RTDX2004

I was going to say something about the Region 1 IARU Conference held in Spain recently. Listening to the wails of anguish from the packet operators when their demands for extra frequencies were rejected 18 to 9, makes one wonder if they going to realize the problems of their system on the HF bands. Maybe we should rethink the system, and come up with something that can stand a little QRM.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1ACB, JA1BLV, OD5NG, TG9VT, VE3JPC, VK2EG, W1DA, W2JGR, W6/G0AZT and the Tri-State DX Association VHF packet cluster.

QSL Information:

YV0AA will QSL via YV5AJ, the radio club in Caracas.

ZK2RW, Ron will QSL from his home address of ZL1AMO.

HI8BG says to send his cards to Box 163-9, Santo Domingo, Dominican Republic.

FM5WU collects his cards from F6FNU.

TR8JLD QSLS via AK1E.

ZD9RT says to QSL via the ZD9 buro or ZS3WJJ (see notes).

AH3C/KH5J will QSL via OH2BN as soon as the logs arrive.

Notes Of Interest:

First, Spratly is active on CW, but nothing reported on RTTY as yet, but they say that they will be on RTTY soon. Crossed fingers.

ZD9RT or ZD9TR is a bit of a mystery. He says to QSL via the ZD9 buro, there is not one, or to QSL via ZS3WJJ who is not listed in the 1990 call books. Work first worry later.

S2 Bangaladesh, should start soon, if all goes well, though Jim Smith has not been heard for the past week. But keep hoping.

ZS8MI, Marion Island operator has returned home so his cards should be available soon, we hope.

Nothing has been heard about the Cocos Island TI9 operation of late. One wonders what is happening, if anything?.

Some say that the cards for JT0DX are starting to appear. Others say not. This also applies for the TT8AG cards, but hope never dies.

To those going to Dayton, have a good time and dont talk too much.

GL DE DX1 (VK2SG) via TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA

Subject: Lots of Questions

------------ Letter Body Part 1 - Text ------------

Hello All!

I have recently had my interest in Ham Radio rekindled and I have decided to go ahead and take the exams. I plan to go for the General Class licence some time in May. I have been looking around at all the equipment that is available and I have about one million and one questions. So if you don't mind I would like to ask you a few!

I plan to spend around $1500 and I am most interested in the HF bands and DXing. A few people I have talked to have recommended the Kenwood TS-440S. If anyone has any thoughts on this rig I would really appreciate hearing them. If you have any other recommendations, I would also be very interested in them.

As far as antennas are concerned, some people have told me that I will do just fine with a simple vertical antenna. Others have said that it is worth investing in a beam. What kind of antennas would you recommend? If I get a beam, will I also need a rotator? Is it worth the extra cash? I have seen a lot of adverts for antennas, some of which say that they are pretuned for a particular band, or that they can automatically switch from one band to another. Will I need an antenna tuner if I use one of these antennas?

One final question (for now anyway!!), I know all this infomation will be in a book somewhere, so if anyone could recommend a good book too, I will be very grateful.

If you send your mail directly to me, I will summerize to the net.

Thanks in advance,
Andy Greenshields [dxandy@widener.BITNET]

What is a reasonable price to pay for a used Kenwood R5000?
Other than exchange differences, are there differences between
US and Canadian prices? I have the impression that US prices are lower.

Thanks, in advance.

>obviously works because I get a turn on thud.

The turn on "thud" only indicates that power is being applied to the audio section. It does not necessarily indicate that the audio section is good.

First try some simple checks. When you adjust the volume control, does the bargraph track? When you adjust the squelch does the channel busy led come on at any point? If the bargraph tracks your control system is probably ok and if the squelch led works the receiver is probably ok. Now if you have or can borrow another band unit, you should check if that works. If it does, the problem is in the 29a band unit interface.

The receive audio path of this radio is as follows:
Audio from the detector in the band unit is fed to an interface unit called the "front end unit" inside the band unit. There it is converted to balanced and placed on the bus (the ribbon cable tying the band units and the control units together. In the control unit the audio is pulse code modulated and multiplexed onto the data stream going out the fiber optic cable to the other control box. In the front control box it is

demuxed and decoded passed through a mute switch and a gain control stage then sent to the output amplifiers through a routing system depending on whether you have the band unit selected as main or sub. If main is selected the audio drives spkr 1 jack, but if sub is selected audio first drives spkr2 jack and if a spkr is not plugged in, then loops to the main jack. So try selecting your suspect band unit as "sub" since the audio goes through a different output amplifier. If this fails, your problem is probably in the digital audio chain.

Hope this is useful

AM DX Test 4/29/90

There will be an AM DX test conducted by WHDH on 4/29/90 @ 0105-0130 EDT. The test will consist of voice, RTTY, packet, and slow-scan TV lasting 25 minutes. The station is a 50 KW operating on 850 KHz. in Boston. Again this at 1:05-1:30 AM EDT on the 29th. Anyone wishing to QSL this event can send thier report to:

Yep, long-path propagation DOES occur on 10 meters. I have worked a number
of Europeans from Hawaii via the South path, about 26,000 miles, using a
vertical 1/4 wave and 100 watts.   The antenna was mounted on the South
side of a condo, with complete blockage of the short path signals.
Generally the contacts took place well after dark here in Honolulu, as late
as 11 or 12 pm. It's easy to tell when the band is going to open to Europe
via long path, since there is an obvious progression of propagation: first
we'll hear the ZL's and VK's, then VK6, then ZS, then Europe as the evening
goes on.

10 meters is an amazing band.

Interesting. This is the same trick they use on my Versatuner. All those nice screws to electrically bond the cabinet together to prevent stray RF from floating about. Trouble is, with all that damned paint there, I might as well leave the lid off.

When Dennis ve7tcp and I were fiddling with his new hf rig, we started by making a few patch cables & c (using those *atrocious* pl-239s you get from radio scrap). I got to build the cables because I'm the only one who knows which end of the iron to pick up :-). Anyway, we hooked the new rig to Dennis' new MFJ dummy load and keyed up - suprise! It wouldn't load. Naturally I was the goat and suspicion centered on the cables I had just built. (Some present questioned the quality of the beer.)

To make a long story short (or rather open) the real problem was that MFJ hadn't bothered to scrape the paint from the case of the dummy load in a couple of strategic places, and we were tring to drive about 500 K ohms or so instead of 50. So even a dummy load can have problems.

Yes, I own some MFJ gear too. I think it's OK for the price.

>
> Ken Hendrickson N8DGN/6   kjh@usc.edu   ...!uunet!usc!pollux!kjh

There are a number of ways one could approach the Yagi stacking problem:

1. Use a generally accepted "rule of thumb"; these usually provide resonable results.

    For stacking Yagi-Uda arrays, the one wavelength distance does provide maximum gain. For extended Yagi's (i.e. very long), another rule of thumb is to stack a distance equal to 3/4 the length of the boom of the antenna.

    Since the requirements stated "maximum gain" without any mention of pattern requirements, the rule of thumb stated above should provide reasonable results for the given application.

2. Use the results published in the literature:

    If it is desired to go into further detail and optimize the stacking distance, I'd recommend reading the U.S. department of Commerce/National Bureau of Standards publication "Yagi Antenna Design", NBS Technical Note 688 author P.P. Viezbicke, December 1968. This publication gives criteria for Yagi design and stacking.

    Another paper I'd recommend is C.C. Lee and L.C. Shen, "Coupled Yagi Arrays", in the IEEE Transactions on Antennas and Propagation, vol. AP-25, p. 889-891, November 1977.

3. Experiment with various distances

You could also experiment with distances around those given by the rule of thumb, and measure both the gain and the pattern in the far field. This does require antenna pattern test equipment.

The considerations such as front-to-back ratio, front-to-side ratio, gain, etc. are both a function of the design of the Yagi itself, and also how the Yagi's are stacked. If the requirements are strict for these parameters, then an in depth analysis would have to be performed.

73's

>Apple Computer dealerships. The local store is even closed Saturdays.
>On the plus side, they're back in the hi-fi stereo kit buisness.

I noticed the latest Heath catalog ("Volume 220", Spring 1990) had a "market research" survey form enclosed in the middle. It was also an entry in a sweepstakes to win $1000 worth of their products. They are chintzy enough that it wasn't Business-Reply Mail, but I decided to invest a stamp, and, since I was doing so, included a couple-page letter of suggestions and customer feedback. I recommend that all other current and former Heath customers do the same -- if they get inundated with user responses, maybe they'll pay attention to at least some of them!

My product-line suggestions included that they come out with a decent-quality $300-$400 range tabletop shortwave receiver, since that is a market void right now, and that they look into the high-end audio market in the areas of minimalist preamps and tube power amps. In both cases, I emphasized that they should first publicize their plans and talk to experts in the field and solicit user input, doing things like going to the ANARC and Monitoring Times conventions to talk to SWLs about radios, and talking with the staffs of The Absolute Sound nd Stereophile about audio gear. Maybe that approach will help them avoid mistakes like their last lousy SW receiver that got such bad reviews.

As a side issue, does anyone out there know when Heath started? The catalog doesn't say. I expected to find some sort of advertising puffery like "serving America's electronic hobbyists since <date>" in it somewhere but couldn't find any such reference. I thought they began in the early '50's. Anybody on the net know for sure?

Regards, Will

Good theory...but ISM isn't the ONLY primary on the band....I believe another primary is a mobile location service (or something like that...) Everyone down in the LA area has thrown up their hands in recent months because a commercial system is to be installed in the next couple years using something like 7Mhz of the bottom end of the band.

Anybody have better/more accurate details of this?

All of the propossed ARRL band plans are out the window right now because of this system.   Since this other service is primary.. amateur repeater interference won't be tolerated. I also believe this same company is planning on installing similar systems in most of the major metropolitan areas over the next 4-6 years.

Forgive me if I am restating or missing something... I am new to this newsgroup and to Amateur Radio.

It seems to me that amateur international communication could be served by the availability of a public-domain translation system for use with PC-based communication systems. I realize that natural language translation is not a perfect technology, but for people who use Morse code, perfection is obviously not a big consideration.

Do any such systems exist? I have heard of hand-held translators which I suspect are moderately useful for foreign travelers. The draw-backs in these systems is the requirement to carry around the notebook sized machine, and the cumbersome typing-in/reading of the text. These are not an issue for RTTY-type communication systems.

The system I envision is one that provides both the original text on one line and translation(s) under it. A really dumb system would just look up all possible meanings of the source words and display them under the original text. A more sophisticated system would work on phrases, or even use some AI techniques to translate semantics. Since this is not intended for business or diplomatic uses, occasional errors are probably acceptable. I would imagine that for simple systems, real-time translation should be feasible.

Anyone know of the availability of such a system? Or is anyone interested on helping with the development of such a system?

On a semi-regular basis I see both requests and answers to questions for scanner modifications. Rather than have to search and repost this information each time id like to offer to collect this information into one file. Then this file could be place at a site that offers a mail server (you send a request via mail and the list is forwarded to your account). To do this I would require 2 things, (1) a site with such a mailer that is willing to keep this list, (2) YOU to send me your list of scanner modifications.

Rest assured I have no plans on converting this information into a book or magazine article. That all credits (if attached) will be maintained. My only goal is to make life easier for those who want to know and as such im willing to donate the time to prepare and maintain (update) a list.

Comments, questions, offers for a mail server....

X-Reader: NETNEWS/PC Version 2.1

WHAT
I am interested in finding out what work has been done on expert systems or CAD systems for the DESIGN and SYNTHESIS of DISCRETE ANALOG circuitry.

I'm looking for references to work that encompasses the synthesis of systems (eg radio receivers) down to building these at the component level (such as coils transistors, opamps ...).   I'm looking at systems that help you to design such system, not ones that help you optimise IC layouts ...

WHY
This area is inspired by my constant irritation whenever I want to design anything of having to wade through all the books I used last time (when I can remember what books they were) to find out how many turns you need on a toroid for a certain inductance or any of the other myriad of standard formulae/approximations that we all use when designing something, but not often enough to commit to memory.

STORING CIRCUIT IDEAS
A related part of this is the need to store all the neat circuits/ideas one finds in magazines ... in such a way that it's usable by the synthesiser.   I've got a pile of articles about three feet high that I've copied from magazines, great information in there - if you can find it.

HOW ???
If you know of any work in this area, I'd like to here from you, especially if you have references :-) If you have any ideas or constant source of annoyance that you think a system like this should address let me know.

Thanks
Giovanni ZL2BOI

Take a look at the section "small loop antennas" in the "antennas for limited space" chapter of the ARRL Antenna Book. Several people on this conference have reported excellent results with small tuned loops on HF. The primary disadvantage of these antennas is that they have a very small bandwidth; other than that, they radiate like gangbusters. The solution to the bandwidth is to have a remotely tuned motorized capacitor.

Also, note in the latest QST, AEA is advertising a 32" small loop for 14-30 Mhz, 150w. It has remote tuning. Sounds like a winner -- has anyone actually seen one, or a price?

Incidentally, these might make interesting Field Day antennas. They are sharp enough that they'd substantially reduce QRM and overload from positions working CW and phone on the same band.

To all you folks who are so burned up by this guy - why don't you get in touch with W1MFJ, W2MFJ, W3MFJ and all the other MFJ calls you can find, and line them up in the next contest and work BB one by one. It would be fun to listen to.

More realistic is to take AD1C's advice and ignore him.   There are usually V3's on in major contests and at other times. Most of them have US QSL managers and you don't have to suffer through what many of you apparently have.   There are a few countries that have only one active ham most of the time, and you have to work that person if you want a QSL card, but Belize isn't one of them!

Joe--

As previously announced in the AMSAT bulletins that Phil Karn posts, AMSAT will have an extensive redistribution network active during both of the next two SAREX missions.

I write:

Just to clarify myself - I'm not at all in favor of dumping the 902 band.

The statement that Dave highlighted was meant to be sarcastic, for those of you that didn't catch on. What I'm trying to say is that if hams would start using 902, we would have more of a say in whether or not we get to keep the band as well as what other services/emissions should be allowed on the band. Sitting back and complaining that the FCC is taking our bands is not what's going to cure the problem - you have to use them regularly. 902 is almost only used during contests. Very few people use it for normal day-to-day communications and there are hardly any repeaters on 902. Since there's nobody there, everybody seems to have the attitude that there is no reason to use it if you're not going to have anybody to talk to. This is true. But, look at 2 meters. 20 years (or whatever) ago, there were no 2m repeaters, nobody on 2m FM. But look at it today. All that it takes is some interested people getting on the band and actually using it - even if at first it's only for contests.
Hats off to those guys out there who actually use this band.

--- Jeff

Already being done! Here's the info for Canadian MODS DATABASE:

From: bitlib@business.uwo.CA (Business School Server)
Newsgroups: rec.ham-radio
Date: 4 May 89 16:13:00 GMT

This file is: INTRO MODS

MODS database

This database was setup to archive files containing information on how to modify radio equipement to either improve its performance, or add new functions or capabilities to the radio.

This database runs on a IBM 4381 under VM/CMS. The driving software is a homebrew list exploder with extra routines to handle file requests from mail. The software was written in REXX and is available to whomever likes to take a look at it. It was my first real REXX program so be gentil with regards to beauty of the logic.

To access a file from the archive, send a message to the server running
under userid -> BITLIB@UWO.CA
Also you may try the userid -> BITLIB@UWO.CDN

The subject of the message must be ->   MODS

The text of your message descibes what files you want. For example:
sendme intro mods
sendme radio mods
sendme TH215 mods

You can have as many requests in the same message as required.
INTRO MODS is the file you are reading now.
RADIO MODS is a list of files available.
TH-215 MODS is a file that can be requested.

To submit a file for the database, send me the message and I will add your entry to the database.

**Note: If you don't seem to be getting a reply to your requests, it is probally due to the fact that your header doesn't show a reachable address. You must be reachable from UWO. You can place your return address in the first line of your message. Example:

```
  FROM: someuser@somenode
```

UUCP users have had some success by stating their address as:

```
  userx!usery!userz@julian.uucp
```

Julian can usually find most gateways.

Any questions or concerns can be directed to:

Mark Bramwell VE3PZR
University of Western Ontario
School of Business Administration
London, Ontario

Bitnet: MBRAMWEL@UWO.CA   Packet: VE3PZR @ VE3GYQ

If you are having difficulties getting into the server, you can try anyone of these addresses:

```
bitlib @  business.uwo.ca             .ca .cdn & .bitnet are all
          business.uwo.cdn            acknowledged by our system
          uwovax.uwo.ca
          uwo.ca
          uwovax.uwo.bitnet
```

Our mail system will re-route requests for bitlib to the proper id once it has made it onto campus.

Also, just because you made it to bitlib, does not mean that bitlib can reply to you. Lately I have been getting alot of usenet mail bounced back to bitlib.

If you reply address is different than your address in the FROM: line of the header, please make the first line in your message a new FROM: line EXAMPLE:

```
FROM:  jdoe@central.yalevm.bitnet
```

If after a few days of no response, you can try the following:

```
FROM: HAMRADIO
```

This tells the server to post the response to the INFO-HAMS digest! Since everyone can read the digest, you will eventually receive the reply. INFO-HAMS and REC.HAM-RADIO seem to be the same thing (gatewayed <>) Please don't post numerous files to INFO-HAMS using this method else it might get messy(nasty) on the net.

de VE3PZR, Mark in London.

From: MBramwel@business.uwo.CA (Mark Bramwell   519 661-3714)
Newsgroups: rec.ham-radio
Subject: ftp access for mods database

The mods database is now available through the internet.

IP address: 129.100.22.100   HAMSTER.business.uwo.ca

If you want to post a file, please email it to me.

A separate copy is stored on the IBM 4381 for mail users, therefore
I need to know if a new file comes in.

Enjoy, let me know if you have any problems.

I live in a 2nd floor apartment without a balcony, and am trying to get onto HF bands of 20, 40 and 80(!) meters. Have been loading up eight feet of wire using a commercial antenna tuner with poor transmission results, and with the effect that the room lights get brighter on 20 meters, and I get moderate herringbone cable-TV interference on 40 and 80 when loading at full power of one hundred watts output. Currently, I am wondering whether loading up a horizontal loop would result in less local interference and more radiated power. Does anybody have any experience or suggestions?

Y.N. Miles,

I have a Kenwood 721 radio and have been wanting to interface this to my repeater to provide a simplex I/O. I want to be able to control various functions of the radio, basically those available on the RC-10 remote handset.

All of the functions from the RC-10 are controlled through the microphone plug. I am wondering if anyone has the communications protocol from the RC-10 to the microphone plug.

I called Kenwood in California today and talked to their technical support. I was told that they didn't have the information but had "heard that some hams had received this information directly from Tokyo but it would take awhile to get a response".

Before writing to Tokyo, I decided to see if anyone on the net had this information.   Any help would be greatly appreciated.

Thanks

From time to time they have a shot of the "ham shack" (garage) and Willie's call is something like KXY913 or something along those lines. It is not a real call, although it was nice of the producers to have taken the time to use real hams gear. Along the same lines, I was watching Die Hard (starring the guy from Moonlighting...the name escapes me) and they were using either Kenwood TS41's or 21's for their communications. Funny thing, how did he know what frequency the cops used in LA? He was from New York. And wasn't it convenient that it was already dialed in? :)

I THINK the formula for Drake 4-line crystals is:

F(crystal) = F(low end of band) + 11.1 MHz

The 11.1 number is what I'm not sure of. Check one or two of the other crystals to see if this is the right number.

Forgive me if this has 'been done to death', but I haven't seen
it since I began reading these newgroups. (~6 mos)

I'd like to assemble a list of 'electronic component dealers'.
If you would care to mail me a list of your favorite dealers
along with phone number, address, and any 'speciality', I will
assemble the list, verify the addr and numbers, as well as things
like 'catalog available', 'minimum orders', etc and post the list.

Once again, if this has already been RECENTLY done, I beg your pardon.

Thanks in advance

  RF input power is the DC power at the last power amplifier stage.
  The FCC used this type of measurement because it was easy to do with
  simple DC meters.

  RF output power is the power coming out of the last power amplifier
  stage (and presumably to the antenna). It requires an RF power meter
  to measure it.

  The difference betweent the two powers is accounted for by the
  efficiency of the amplifier.

As has been stated many times before in this forum, The INTERNET can not be
LEGALLY directly gatewayed to amateur radio. The content of 90% of the traffic
is unsuitable for amateur radio transmission.

However I applaud the use of radio to extend this kind of service to people
who would otherwise have no way to get access. I have long been an advocate
of using the technology we have developed to bring more and better service
the the general population. I think that packet radio technology can be put
to use in building inexpensive networks for lower level schools who don't
have the resources of a university.

Maybe if we as hams started setting these systems up and showing schools and
libraries etc. what could be done with it, we might win back that mystique
we once held with the general public. Radio by itself no longer mystifies
anyone, but we have much more than that to offer today. Lets stop hiding
our lamps under bushel baskets and get out there and show that there is more
to ham radio than field day.

I would also be interested in any information on this out there. Many other toy 49 MHz walkie-talkies sold by the rat shack as well as others contain a similar configuration, and I have 4 of these at home, waiting for 6M conversion. It seems easy enough, but any real help would really be appreciated. Thanks and 73's, Mike, N7MSD

For those interested, the first real convening of the College and University net went fairly ok. Propogation was really good to the western US and we spoke with several stations. Unfortunately, only one was really affiliated with a university. I don't have the calls at hand, but the two gentlemen were mobile and were from UCSD. We discussed the possibility of them operating from the site of a crew regatta their school is sponsoring. Wash U. is participating and I am sure several other schools that may have radio clubs are as well. The competition is this weekend and I got the impression that they would be there on Saturday. We are going to try to link up with them and find out how our team is doing if they ever get back to me with the times and freqs they will be on. (Yo, Andy! Are you out there?)

In any event, we will try to convene the net again this weekend. Again that is 28.425+-, Saturday at 1800Z. Control will be W0QEV here at Wash U. If you have any questions, let me know. Hope to see you on the air....

73,
Scott - KA0WCH

There are THREE possible ways to increase the usage of 33cm:

1. Increase the amount of radio activity the users of 33cm do.

2. Increase the number of hams and hope the new ones use 33cm.

3. Move some of the hams from other bands such as 80m and 20m to 33cm.

Given an already very low number of hams on 33cm, if each ham were to operate 16 hours a day, it would still not be enough.

Of course the current "no-code" bunch is already trying #2. Now if all the people who are against a no-code license, would do more of #3, then maybe we won't need a "no-code" license.

Let's set a goal. If 50,000 amateurs will change their primary operating band from an HF band up to 33cm, and operate at least 3 hours per day, then I will back down from my efforts to get more hams who are interested in UHF into the hobby by means of a no-code license.

6 users in one area don't constitute sufficient usage to make the band nearly used as other land mobile services use their bands.

Unless we can get MOST of the OF's off HF and onto 33cm, we might as well write the band off for anything but a few isolated point-to-point links which could be just as well done on 23cm or 13cm.

My interpretation of the ARRL log file format requirements indicates that they are intending, at the present anyway, to just PRINT out the file you send them.

It would be nice if a general purpose file format can be designed for logging info that can handle a large number of cases and contest types. I believe it can be done, and done more efficiently than a plain printable format.

Does the ARRL accept the files compressed? I don't know yet if large logs in the format they now want would fill up a disk. They should be prepared to accept some of the defacto standards, such as .arc, .tar.z, .zip, .zoo, and .z extensions.

Koffi Magliore asks about the status of Digital Radio. I gather, from following Broadcasting magazine, that digital radio is going to be real in Europe fairly soon. The interest there mostly centers on Direct Broadcast Satellites (DBS), with gap-fillers on the ground for tunnels, etc. Filling in the blanks in the non-technical articles, some sort of pseudo-random coding is used, since they talk about multipath being a benefit to improve coverage. A big pitch and demos happened at the (US) National Accosiation of Broadcasters (NAB) covention last weekend in Atlanta. It is recognized that US policy on broadcasting would require Digital Audio to be a terrestrially-based service here, not DBS. Numbers bandied about include up to 24 audio services multiplex on a 4-MHz bandwidth transmitter. The Europeans (often French) who are pushing the most, talk about using schemes to reduce the required bit rate by "not sending the unneeded part of the sounds". (see more below)

As hams, we should be most concerned by the statements that the Digital Audio people have decided that the 500 to 2000 MHz region is the only one suitable, and that they need about 100 MHz of that region!!!!!

Currently, there is a fair amount of digital audio used to distribute radio programs by satellite. While I would reallly like to know more about the subject, the scheme seems to be to sample the incoming audio at 32,000 15-bit samples per second (barely adequate for the claimed 15 kHz response), and block the samples into groups of 32 (or is it 64 for stereo) [one millisecond worth]. A scale-factor is then determined for each block, and the block is sent with 11-bit audio (not the 15 bits of the original samples), with a single scale factor for the whole block. The process is reversed upon reception to compander back to a 15-bit dynamic range (~ 90 dB). Note that the distortion is roughly that of an 11-bit signal, say 0.1 %. National Public Radio uses this system and markets it commercially. ABC-radio also distributes by digital audio.

My knowledge is sketchy, in that I don't know what 7-8 code expansion they use, what error control, etc., etc. The equipment, from Scientific Atlanta and others (?), gets about 24 channels on a single transponder, any 15 kHz audio channel can be split into two 7.5 kHz channels, etc.

Does anyone have more (or better) info?

Bob W3OTC

>Excuse my intrusion into this ham group but I think this is the best
>place to get my technical question answered.
>
>RF input power; RF output power;

Actually, the *input* power shouldn't be expressed as "RF" power; the typical input power measurement - and the basis for most power-limit regulations - has to do with the DC power supplied to the output stage. This is simply the product of the DC supply voltage and current delivered to the final stage, except for any filament supply (if any).

The RF *output* power is just exactly that, and is intended to mean the actual honest-to-God RF power that the output will deliver into its nominal load - usually 50 ohms for amateur and CB transmitters. It can easily be measured via an in-line wattmeter or by RF voltage measurements on an appropriate dummy load. The output power is obviously less than the input power, as no amplifier can be 100% efficient. 4W out for 5 in is pretty unrealistic; your 2.5 - 3.5 (at the outside) figures are much more believable for an AM transmitter with a typical output stage. Output power, as measured in this manner, in NOT dependent on the antenna used, although everything after the output stage - cable losses, whether or not the antenna is properly matched, etc. - plays a part in determining how much of the output actually makes it out as useful radiated energy. "Gain" antenna such as a beam or quad do not actually increase the power, they simply concentrate more of the radiated energy in one direction (at the expense of all others).

A favorite marketing ploy for CB transmitters which include single-sideband mode (SSB) is to quote the "peak envelope power", or PEP. This number CAN be greater than those quoted for AM outputs, as power measurements for SSB are not as straightforward as those for AM; the SSB envelope precludes the simple voltage-across-the-dummy-load technique as a meaningful measurement. However, the *DC* input to the final stage is still the same, and that's what the FCC is (or at least used to be) concerned about. (I believe that the CB regs were revised to limit the RF output power to 4W some time back for AM rigs, with an appropriate PEP number for SSB transmitters.)

I have a question about what exams to take. But first some history.

I got interested in electronics when I was in grade school, sometime in the mid '60s. I started studying for a ham license, but lost interest (what's the average 6th graders attention span?) when my code speed was only 2-3 WPM (remember code practice LP's?) Well just the other day, when I was trying out some PD and shareware programs on a new PC, I found a Morse code training program. I discovered that with a few minutes practice that I could now copy alphabetics at 5 WPM! Osmosis or something.

Anyway I looked at some license prep books, and decided that I could pass the written for both novice class (2) and technician class (3a). But one of the books recommended against taking both tests at the same time.

So my question is: should I take one or both? What's the problem if I try to take both exams at the same time?

Thanks,

```

In response to KA9WGN's comments on the ARRL file format:

> My interpretation of the ARRL log file format requirements indicates that
> they are intending, at the present anyway, to just PRINT out the file you
> send them.

No, the ARRL Contest Branch will read the file, convert it into a binary format and then add it to a database of contest files. Each file will be checked for dupes, the multipliers will be determined and counted, and the log will be scored. They will also be able to do cross-checking and unique call sign analyis of logs (identifying calls which are "unique" to that log compared against a database of all known good calls, active calls in contests, calls contained in other logs or calls who's log has been submitted). The uniques analysis capability is being developed -- other groups such as the CQ Contest Committee and various individuals have been doing "uniques" analysis for a number of years. A contact labeled as "unique" MAY be a bad call, but not necessarily. A high unique rate raises eyebrows regarding the accuracy of log, but is NOT absolute proof as to the accuracy of a log. It's analagous to the IRS, but hopefully the logs are more accurate than tax returns...

> It would be nice if a general purpose file format can be designed for logging
> info that can handle a large number of cases and contest types. I believe it

The format we developed should handle all contest types since the data in it is common to all contests. A binary format (rather than ASCII) would be more efficient -- considerable discussion of binary vs. ASCII took place before we decided on our course of action, which was described in the original posting.

> Does the ARRL accept the files compressed? I don't know yet if large logs
> in the format they now want would fill up a disk. They should be prepared
> to accept some of the defacto standards, such as .arc, .tar.z, .zip, .zoo,
> and .z extensions.

You raise an interesting point. I don't see why not as long as it was a commonly used compression routine. But 99% of the logs should fit on a 360K floppy without compression.

Anyone have the listing for the various model numbers series? I know many of the numbers of the Motrans and earlier. But the later model radios have left me in the dust.

By the way, have 5 UHF 2 freq carrier squelch MT-500's with two rapid chargers and 2 Hi-band 5 watt 2 channel HT-90's with 1 rapid charger with anyone is interested.

Somebody asked about the Maidenhead Grid Square Locater System. Here are the details of how this system works. This system is in widespread use in North America on VHF/UHF/SHF/EHF. I believe that it is also catching on in Europe. I think it is one of the best location identification schemes ever developed.

The world is divided up into fields. Fields are divided up into squares. Squares are divided up into sub-squares.

Each field is 10 degrees N-S by 20 degrees E-W.
Each field is indicated by a two (capital) letter identifier. The South-Western most field is AA. This field is actually a triangle, and it is located from the South Pole to 80 degrees South, and from 180 degrees West to 160 degrees west. The field directly north of AA is AB. The field directly north of AB is AC. The field directly east of AA is BA.

Each field has 100 squares. Each square is 1 degree N-S by 2 degrees E-W. Each square (inside it's respective field) is indicated by a 2 number identifier. The South-Western most square in a field is 00. The square just north of 00 is 01. The square just north of 01 is 02. The square just east of 00 is 10. The North-Eastern most square in a field is 99.

It is meaningless to refer to a square, without first identifying it's respective field.

For most amateurs, this is enough. On VHF, for example, when I lived in Grand Rapids, Michigan, I identified my location as EN72. On higher bands, (or maybe for other reasons), you might want to identify your location more accurately. For this, sub-squares are used.

Each square has 576 sub-squares. Each sub-square is 2.5' N-S by 5' E-W. Each sub-square (inside it's respective field) is indicated by a two (lower-case) letter identifier. There are 24 x 24 sub-squares in each square; each sub-square is pretty %^&* small. The South-Western most sub-square in a square is "aa". The sub-square just north of this is "ab". The sub-square just east of "aa" is "ba".

It is meaningless to refer to a sub-square, without first identifying the field and square.

When operating on the higher bands from my GR, MI QTH, I identified my location as EN72eu. To wrap this up: The fields, squares, and sub-squares adjacent to mine were:

```
                  EO

                  EN73

                  EN72ev

DN   EN62  EN72du EN72eu EN72fu  EN82   FN

                  EN72et

                  EN71

                  EM
```

This is my biggest complaint against Kenwood. They use the cheap chassis mount connectors. For just a few pennies more, they could put a panel mount connector that would never wear out or need replacing. The panel mount connectors have a square flange, and four mounting holes. I have had to replace every connector on my Kenwood gear. Why must they all produce chinsey gear? Whatever happened to quality?

Hello there,

Could someone tell me a little bit about DIGITAL RADIO and its furure
worldwide? How is it going to surpass FM and AM?

How is the FCC will be allocating the frequencies and what are the major
public policies involved in the USA?

Some references would also be helpfull.

Thanks!!!!

I am making QSL cards and am trying to find out what grid square
my home QTH is in. The city (village) is Sister Bay, WI
Looking on a 15' topographic map, I estimated :
40 deg, 11.5' N, 87 deg, 7' W
But looking at the National Atlas of the US (published by the gov't) says
45 deg, 11.3' N, 87 deg 7.3' W
I dunno if this is city (village) hall or not, but
a) Sister Bay isn't all that big
b) I live pretty close to village hall
I know there was an article in the (aug 89?) issue of QST, but all the 89
issues are missing at the library. I would like to know how to find out my
grid square and/or what it is. I really want my SIO (oops)
SIX digit grid square (yes, 6, and yes, I am wierd)

Since I doubt this information is of interest to anyone else, I think
e-mail would be appropriate. Thanks.

>I would like to know if Spring and Summer has any effect on reception.

I've found that in my experience, at least, it does -- in particular my
winter reception of stations around 8-10 MHz is much better than in the
summer. All winter I have been able to receive several US WEFAX

stations very well which are now beginning to deteriorate in quality; if last summer was typical, it will stay that way all summer. I am guessing this has to do with the amount of time the upper atmosphere is exposed to solar radiation during the day, and/or the incident angle of the radiation being greater in the summer. But I don't know for sure.

lawrence@smcnet.UUCP (Lawrence Roney) writes:

>Our Earth Science Department purchased a Kenwood R-2000 HF receiver and an AldenElectronics
>9321 Weather Chart Recorder for reception of radio fax weather
>pictures.

Well, you have purchased a very wonderful piece of equipment. Clean all the mess off of it (I'm assuming you bought one of the FAA surplus models?), buy the maintenance manual for it, and look carefully at how it is constructed. This is how electronic things are built when maximizing profit through minimizing the production costs is not the primary goal. I think you could mount it on a truck and drive around with it running and it would still record. Well, probably not really, the loop electrode assembly would bounce around. It is really easy to maintain, too, and its principles of operation are both easy to understand, and somewhat amazing -- it's the first place I ever encountered a "sample and hold" circuit... since it is built in discrete components rather than on an IC, you can see how it works. It's fairly amazing the way it captures the voltage at the peaks of the AM carrier cycles on a small capacitor between two MOS FETs. The only problem is moving it... when I moved to a new location awhile back, the mover threatened to quit when they saw the equipment because they didn't want to carry it down the stairs, it's so heavy.

If you're buying the replacement parts (you have to replace the loop and blade electrodes regularly, plus other parts that occasionally wear out, and also buy the wet electrolytic paper for it) from someone other than Alden, write to the address that's on the chassis and ask for pricing information. You might ask for the original advertising information on the recorder, too... it's interesting how expensive the optional parts are, new. I'm not sure how much the recorders sell for, new, but Alden still sells them.

>Nonetheless we have never seen anything printed in the fax machine except
>black lines.

Yes, it only has an AM demodulator in there unless you have a special model. I posted detailed design information for an FM demodulator *specifically* for the Alden 9231 about a year ago, which you need to demodulate the FM subcarrier that is transmitted on HF. You can receive pictures from the polar satellites, and from the GOES Tap if your have that, directly with the 9231, though, since that's what its demodulator is for. One problem is that the 9231 emits RF interference fairly strongly on 137.4 and 137.62 MHz, as well as random noise from the switching of the marking amp on and off. I wish it didn't since those are prime polar satellite frequencies, but I guess it passes the FCC emissions regulations, and it was actually made for use with leased wire services. I've never been able to figure out what causes the interference, but it comes from the master oscillator board, which runs at a much lower frequency. If you figure out how to reduce the RFI I'd be interested. One problem I found is that the signal input line goes directly past the power supply line to the marking amp (it's wrapped inside the same bundle of wires), which inductively picks up noise from the marking amplifier transistor turning on and off.

>   -- Is there a better way to receive weather pictures with different gear? Is there a TNC and PC setup that might work better than the paper based fax unit?

Yes. The best I've found is the A&A Engineering demodulator using a PC with a VGA, about $120 or so. There are commercial programs such as the Elmer Schwittek MultiFax software package you can use to display output from the A&A demodulator on the PC. These give photographic quality images, compared to the good but limited-contrast and limited-resolution images of the 9231. The 9231 is best for recording weather maps rather than satellite pictures.

>   -- What should the receiver bet set on? (AM, USB, LSB, CW)

For HF stations, set it on USB or LSB -- if you set it to the wrong sideband you will get a negative image and will know you need to use the other (also the recorder won't sync properly if you're using the wrong sideband).

For direct reception from the polar satellites, use FM, but you need a WEFAX receiver for that. Despite what people say, other kinds of receivers won't work very well... I've tried it. You get a picture but with a lot of noise and poor grey scale. The WEFAX receivers are relatively inexpensive compared to general-coverage receivers and scanners.

>   -- Is a long wire good enough or do we need a beam or something?

Yes, a long wire is fine for HF. For VHF from the satellite, you need a circularly-polarized antenna such as the WEFAXTENNA from Vanguard.

>Any assistance or help would be greatly appreciated. Earth Science won't let me walk down their hall until I get this thing working.

I hope the above will be of some help.

Noted in the latest W6GO QSL list:
  V31BB - V31BB says he DOES NOT QSL; save your money

Heard during the WPX 'test last weekend:
  V31BB - "Don't send me your stupid card. I don't want your
            card. I don't want your stupid IRC's. I don't
            want your money."

(However, he has never been known to return either IRCs or money.)

I can understand a DX station that is tired of the bother and cost of QSLing, and just wants to work contests, or QSO. But I have trouble figuring out why a station who has a stated NO QSL policy frequently runs DXpedition-style ops and builds pileups (You're 59. Next.) Why does he think those stations want to work him...

Also heard from BB during the 'test: A very new ham with a novice call called him, and instead of of just giving him a quick 59 #nnn, added "You'er my first DX contact. I'm only running a dipole and am thrilled you heard me." BB proceded to rake him over the coals for at least three minutes, for wasting him (BB's) time with meaningless information, etc. etc.

IMHO, this guy gets the Jerk of the Year award. His problem is he is on a power trip. He gets his kicks from hearing people scremaing for him in pileups and begging for QSLs. Please don't add to his ego - next time you heard him on, work someone else.

Also heard: Some DX club has built a rent-a-QTH in Belize, so it should become real common. Wait and get your QSL from a real ham.

Having just bought a Versatuner II, I second the motion. The ground terminal tends to come loose without provocation (proving the SWR protection circuitry in my TS-680 works as documented), and the SWR/power meter tends to stick. When I went to adjust the meter I discovered that there is no adjustment screw for it, and even if there was, the damned meter is GLUED to the front panel! Mind you, Patty is right: it will tune anything in sight. (Well, I haven't tried it on the cat yet ...)

I learned the code at 6 years old while still PRINTING in block
letters.....the theory was a bit difficult...BTW: I am NOT an
extraordinary youth, just ask my mother....

> The statement about people of 7 and 75 learning code is not complete.
> There is no evidence that this capability is existant in 100% of the

> good.

SOME people have a severe lack of discipline....
I want to be an EE, so why should I waste time taking all this
English Lit and History?? Does that mean I have an attitude problem??
If we apply the no-code argument to this analogy, you will see what
I mean by lowering the standards being dangerous.

> Further, because hams have (and certainly at least in the past this has
> been MOST hams) wanted everyone to pass a code test to "get in", the

*** BLATANT GENERALIZATION ALERT *** Your opinion of what MOST hams
wanted is no more factual than the perceived view of code being the
big "boogie-man" to people getting into ham-radio. I never EVER heard
any ham say anything to the effect of using morse code as a "hazing"
or passing of rights. I have only heard this from 'outsiders' that
feel victimized for some reason. The only reason I ever wanted someone
to pass a code test was because it was required by law and I wished to
see them enjoy the same hobby I have enjoyed. Who in the heck ever
started the "good-ole-boys" or "Ham-fraternity" thing anyway. The
only thing an 'outsider' ever needed to do was ask a Ham how to get
started. It has been that simple for decades, and has been done
a million times.

> Probably everyone has an attitude "problem", but some of us are just not
> making much of an effort to get along with those who have a DIFFERENT
> attitude problem.

The only attitude I have a problem with is the one that thinks code
is "The big barrier" to ham-radio that "discriminates" against us.

> > BTW, I am not an objector to a no-code intro level licence, there is a
> > VHF only n0-code going into effect here next September and I think it

It'll fit on the computer.....what a justification for a license
system with today's technology :-|

> --Phil Howard, KA9WGN--
> <phil@ux1.cso.uiuc.edu>

In spite of my better judgement I have gotten caught up in this long
winded issue. On this note I will drop into the QRM and shut up.
I have no particular reason to oppose the no-code class, but this
bad feeling keeps nagging me. It is not that I want to keep all the
spectrum to myself and lock out the "fraternity", but wish to preserve
what is good and courteous (whats left) about my hobby. Ham radio has
been in my family since 1934 so alot of my "attitude" comes from the
way I was brought up and the old-fashioned ways of radio my grandfather
taught me. Old habits are hard to break, and old values are hard to
give up. It is time
to drop this whole thing cuz TIME will eventually prove one side right
or wrong. Unfortunately, if it was wrong, it will be impossible to
undo. Perhaps this is why the whole thing makes me nervous.

PRAYING THAT MY DOUBTS ARE UNFOUNDED...... es gratious big welcomes
to the new guys when they get here. The only thing to do now is be
a good example for the new ranks and enjoy the new contacts.

de km4jn :-) love them sun spots....

Just an ethical question. I live in a very rural area and wish to put a phone patch at my QTH. I was planning to do it cross-band by using the TS-680S in the car to go to the house on 6m FM, and back out on 2m. With the "links above 220MHz" rule, how is this classified and is it legal?? Do want to be legal now you know.

Does any one out there have a UNIX based control program for the Kenwood TS440? I am running 386ix and would rather run a control program from UNIX rather than from VPIX.

Thanks

Here's one for the VE's: I have become acquainted with a physically handicapped individual who fairly recently obtained a Tech license (N5PSX). His handicap is so severe that he is confined to a wheelchair, can't speak plainly, and his hands are so knarled that he can't hold a pencil (or even "unbend" his wrists). He uses a computer to send various phrases, but can, by a slow and laborious process, punch in characters key-by-key- or on regular "brass". He can copy 5 to 6 WPM by the "hunt-and-peck" method on a keyboard.

Problem is, he is technically and operationally capable of passing the General and could pass the CW portion if he could copy down the characters fast enough. "Head copy" is ruled out because few people can copy and remember a five-minute conversation in their heads. I would like to know if anyone has had any similar situation and if there is a provision whereby the 13WPM cam be waived due to such a physical handicap. Please post your responses so others who may have had (or may encounter) this situation will know how to proceed. Flame me directly if you must, not via the bb.

Thanks in advance,
Dube Todd, N5PDK

Yes, we certainly appear to have no-code rammed down our collective throats. That does not mean that we should give up the fight, though. I intend to fight it with every byte of my hard disks and every pin in my printhead.

Yes, I agree that nobody is going to change anyone else's mind among the hard-core - which includes 95% of everyone who's posted a message on the group. The FCC's mind may be made up as well, just as it was on the 220 rape. If nothing else, though, I hope they'll get enough comments to know they've been in a fight.

To the guy who suggested a rec.ham-radio.debate group: it was suggested before, and that generated the HAMLICEN mailing list. It was taken over almost completely by the anti-code types, and while I continue to read it, I won't contribute to it - I can't afford to replaced a modem that's been flamed to a crisp.

       ^^^^^^^^^^^^^^^^^^^^^^^  aaaaaarrrrrrrrrrrggggggggg!!!!!!!!
Ken has indeed given three instances where cw is very useful. I didn't
ask for instances where cw is useful. I ask for an explanation of the
usefulness of the cw *REQUIREMENT*. I will counter with the argument that
packet radio allows much more rapid dissemination of bulletins, therefore
every ham should be required to understand how to decode AX.25 headers.
RTTY contacts can be collected for a special endorsement on a WAS certificate,
therefore every ham should be required to regurgitate the BAUDOT code.
I could go on.

 >                       ....   I could go on, but I don't think you want
 > me to.

Yes I do want you to go on. I am very open to being convinced that all
of the sweating I did to pass that stupid code test was useful. No one
has convinced me yet.

I will never argue that code isn't useful. I would never try to get rid
of code from the bands. I am saying that the code requirement keeps
qualified people OUT of ham radio without keeping LIDS out. If ham radio
was growing and staying on the leading edge of technology I probably
wouldn't be nearly so venomous. As it is, the code requirement for
```

a reasonable vhf and up license is no wiser than handling radium just because Ms. Curie did the same.

I didn't like broccoli when I was 5 years old. I didn't even like it when I was 15, but I DID NOT STARVE OR GO HUNGRY. Now I like broccoli.

It is human nature to not like something someone pushes you into. But once you get to just see it for what it is, you might very well find you do like it.

What code is NOT is the ideal communications emission.
What code *IS* is a lot of fun for a lot of people who CHOOSE to use it.

Let there be CHOICE and not force.

I bought an Azden 2m HT (no model number but I believe they only made one model) at a hamfest and haven't yet figured out what all the buttons do. The person I bought it from told me he was going to snail-mail me an instruction book but evidently forgot about it (and I've forgotten his name). Does anyone have one they can xerox and send me? I will happily pay for postage, copying, and nuisance. Send e-mail and we can make arrangements. Thanks!

>The Omega navigation system status report continues to be broadcast at
>16 minutes past the hour. Although I have not heard it yet, I
>imagine that the GPS report on WWVH is given at 45 and 46 minutes past
>the hour just before the Omega report at 47 minutes past. Can someone
>confirm this?

To answer my own question:
I managed to catch WWVH one morning and can report that they carry the GPS message at 43 minutes past the hour with a repeat at 44 minutes past. This is followed at 45 minutes past with the solar activity / geomagnetic field report, at 47 minutes past with the Omega navigation system status report, and at 48 minutes through to 51 minutes past with Pacific Ocean weather.

I bought a Visitel picture telephone a couple of months ago to stay in visual contact with relatives. The thought occurred to me that it could also be the "poor man's" method of slow scan TV on ham.

Questions:

*   has anyone tried it?
*   any complications?
*   is it compatible with any mode of existing "regular" slow scan TV/ham equipment?

For those not familiar, Mitsubishi, Sony and Panasonic are now selling video phones which are equipped with a small camera and b/w monitor that just plug into a modular jack and allow you to send stills down a regular phone line. You look into the camera, see yourself on the monitor, push a "freeze" button when you like what you see, and then transmit the still shot down the phone line to another compatible phone by pressing a "send" button.

It transmits audio tones. Transmission time is about 5 seconds.
You can't talk while the picture is being transmitted.

Fortunately, all three vendors have compatible transmission formats.

I've been trying to find someone else with a Visitel on the air on the 10 meter slow-scan net which meets Sundays from about 11AM-6PM Pacific time on 28.680. Attempts to send a Visitel picture to other hams with "regular" slow scan systems have failed; the equipment used by those particular hams wasn't compatible, unfortunately.

Any comments? If you're interested, see you (hopefully "see" literally) on 28.680 one of these Sunday afternoons.....

John Kirby

Dennis sri to post this on net, but didnt write down ur adr.
 So do not through out that mc 60a its ok.
 Idid the same thing (embarrassed my-self at the dealer), so try this.
Hook the coiled cord to rig and the base of stand.
Hook the short cord (this was the clew as to what was wrong) from base of stand to mic.
to the mic.
This thould do it the up/dwn buttons control the mem. select on my ts440s
dont know what thell do on ts530s 73 good luck

In case you hadn't noticed, the time setting for HfRO was "just after Gorby took power". Things have changed since then. Besides, ANYTHING is possible in fiction. Ask Tom Clancey if HE can copy code.

> After seeing the movie, I wondered if there is some standard international

I'm sure there are. And aside from the editing, I'm sure they used them.

Now that we have settled on shifting the code test over from ham radio to submarine officer qualifications, maybe we can go on to more interesting postings.

An alternative is to increase the charging time. Sorry I can't make any specific part suggestions since I don't the details on the pack. I assume you will only be slow charging it. Given a 33% increase in capacity, at least a 33% charge time increase is called for (now 20 hours instead of 15) but how often to do you actually commit to charging the pack from dead in 15 hours and need it in less than, say, 24 hours?

For real, Litz (as in wire) is short for _Litzendraht_. I don't speak
German or whatever language that is, so don't know if it's a proper
name or has other meaning.

Looks like I'll be spending at least a week- maybe two in Durham, England this July. Hopefully Digitrex will have shipped their QRP box sometime between now and then so that I can get in a little operating in my spare time. Along those lines:

--Can someone advise me of the proper steps to be taken to get a reciprocal operating permit?

--What's the 2-Meter situation in GB, and (hopefully) in the Durham area? Should I take my HT? How about 440?

--Any other hints? Perhaps we even have some Northumbrian hams in this list?

[More deleted]

Maybe I missed something... But this sounds harder than learning the traditional way (that is, hearing the sound pattern, and then writting down the character for that sound pattern), and is also a useless skill! At least CW is useful!

I teach Nervous (oops... Novice) classes, and occasionally get a few very smart student who tries to beat the system... He usually falls behind the rest once he realizes that his 'method' causes problems, and he can't copy the code. Now he (or she) realizes (sp?) that all the time that was spent studying with this new method could have been spent on learning the code.

What works best for my classes is the following:

Morse (from day one) is sent at a character speed of 18WPM, the spacing is adjusted to provide for 5WPM (Note that the ARRL has now switched to this method for the VE exams, and their practice tapes). I explain that one needs to practice every day, and if one has the time, two to three 10-15 minute sessions will do.

Those who follow this schedule can pass the Novice/Tech 5WPM exam in about 4 weeks... Those who can't devote this much time (some of us have jobs/family, etc) take longer.

If you want to learn CW (Morse code), then spend a little time, you only need to give it a chance.

By the way... the most important point that most people don't realize:

When you are trying to learn Morse code to pass an exam, you MUST write each character as you hear it. Listening to a tape (or radio, computer, etc) while you are doing something else won't hurt... but it DOES NOT SUBSTITUTE for written practice. Many think they can listen to tapes while driving to/from work. They get a surprize when they sit down for a written exam. They must convert each character in their head, and then from their head to the fingers to write the character.

If you can, you want the CW to go into you ears, and directly to your fingers without passing through your brain, this is easier for some than others :-)!

I hope this helps.... It just takes a little practice, and it IS worth it!

(By the way.... I am FOR the no cw test required Amateur Radio operator license class..... We need to INCLUDE people, not exclude them!)

Or perhaps as a modulated signal source for a Transverter.

Or perhaps in the case of UHF, to cover the 420-440 Mhz part of the band
the Japanese forgot we even have (and they have 430-440 themselves).

Also I understand the IC-2SAT can receive on most of 902-928 Mhz, making
it possibly useful as a cross band transsceiver if someone were inclined
to make a repeater with 2m input and 33cm output.

> Aurora can only be effectively utilized if CW is used.
>
> During contests, I can do a CW contact in about 1/2 the time a voice contact takes, and I never have to ask for a repeat.

OK, then we will not allow Communicators the privilege of working Aurora or contests. How's that?

I'd far sooner ban contests than ban CW. I am not proposing either, but would like to see contests restricted to a subband.

Really, most of the people who are sitting out of ham radio because of our stinking attitudes don't give a whit about HF and shortwave and working Bouvet Island. But you guys see those desires as not consistent with being a ham and don't want them, nor their "techno-nerd" attitudes that just might save ham radio so the rest of us who do want to work CW and such can continue to do so through the next century or so, on frequencies we legally have allocated.

> Once, about 10 years ago, I copied a distress call from someone who went down in an airplane, near Mansfield, OH. Since the signal was CW in a phone band, it stood out like a sore thumb and attracted my attention very quickly. I was able to help out these people by calling the local FAA and giving them the details. A signal in any other mode would not have attracted my attention (or anybody else's) like it did. (Note: it was a very weak signal, and I doubt that it would have been copyable if it wasn't CW.

So what?

I'd sure like to know why this guy was on a "phone band" (and I guess you mean HF, you probably don't know there is a VHF :-) instead of one of the standard distress frequencies (500 khz, 2182 khz, 3023 khz, 5680 khz, 8364 khz, 121.5 Mhz, 243 Mhz, etc.). Sure if his aeronautical comm gear went out at the time and he HAPPENED to have a ham rig that survived with power, OR better yet, BUILT AN EMEREGENCY RADIO that he could key on and off with wire contacts, then I can see why he'd be there.

1: these things are rare and getting rarer.

2: the number of hams who do know CW are not going to drastically get smaller as a result of the no-code license. Those who want to forget code do so now. Those who want to never learn it also do so now.

The League accepts for advertising, basically any company that it deems legitimate in its offering to the amateur market- that means, the company delivers what it says when it says for the price it says. This doesn't mean that the quality is superior to anything else it might be compared to, only that the representation of the product is accurate, per the advertisement. It appears that V31BB has a gripe with MFJ that either he could not resolve amicably with the folks there, or he didn't live up to his end of the warranty responsibilty, or he's just an ass (I suspect a combination of the above).

I used to work for Texas Towers as Sales/Service Manager, and we sold a lot of MFJ stuff. By and large, the quality was o.k., not Cadillac, but a reasonable buy. I would say the number of complaints about their stuff were no more or no less than any of the other brands we sold, including the Big Three. I will admit, however, that most of the complaints about MFJ stuff were towards the power-handling capabilities of their low-priced tuners. I never recommended the 300 Watt tuners where the Tx output exceeded 100 Watts, for that reason- the switches are a little cheesy. But, saying that, I also have to say that a lot of hams have no idea how to use a tuner- a large percentage of those returning tuners for repair/replacement admitted to adjusting the tuner with full power applied, a practice that is not recommended by ANY of the tuner mfrs.

I have owned many pieces of MFJ equipment and have always been satisfied.

BTW, MFJ has a good warranty policy and generally won't give you any
hassle about repairs or replacement, IF YOU OBEY THE RULES of their
warranty statement.

'Nuff said, I'm off MY soapbox.

(Cut to scene of KD5RO/2 wildly waving his arms in the air to get
your attention)

I'm active on ALL BANDS, from 1.8 MHz through 10.5 GHz, including
3456 and 5760. I was a part of the group which completed the first
EME (moonbounce) QSO's on 3 and 5 Gig. I have both WBFM and NB (SSB/CW)
equipment on 10 GHz, running 10 Watts out SSB/CW. There is quite a group
of hams here in the Western New York area coming up on these bands- about
five or six in our local club, others in the Buffalo and Toronto areas.
Down in Pack-Rat Country (Philly) there are probably two dozen guys with

stuff on these bands. Up in New England, there are several. The North Texas Microwave Society is a group devoted to these bands and have quite a group on the air up through 10 GHz. Same in the Denver area with the Front Range Microwave Society.

In large measure, the recent increase in activity on the bands above 1296 can be attributed to the work of guys like KK7B and WA8NLC with their designs of no-tune transverters for these bands, and the marketing skills and guts of W3HQT/1 (Down East Microwave), who sells these (and lots of other microwave oriented) products.

Hope this starts to answer your question- BTW, if you're interested in this stuff and want ideas on getting started, email me.

73   Dave KD5RO/2

Oh yeah, I almost forgot- 24 and 47 GHz are still a while away for me, there will be no one else to talk to locally and equipment is rather scarce (surplus at reasonable prices, anyway).

Heard in the WPX contest last weekend:

V31BB: How's my signal up there?
W#%%%:   You're louder than KP2A.
V31BB: Really? Put a note on your QSL card about this and I'll buy you
a beer at the Stoffeurs [sp?] in Dayton.

>But I have trouble figuring out why a station who has a

>stated NO QSL policy frequently runs DXpedition-style ops
>and builds pileups (You're 59. Next.) Why does he think
>those stations want to work him...

Because he counts as a multiplier in the contest, and that's what we
contesters want. Because sometimes it's a thrill to crack a pileup, no
matter who's on the end of it. Because he's not the only V3 on the air (I
worked V32SW this weekend, if you really need Belize). If you want QSLs,
work JA stations.

>IMHO, this guy gets the Jerk of the Year award. His problem
>is he is on a power trip. He gets his kicks from hearing
>people scremaing for him in pileups and begging for QSLs.
>Please don't add to his ego - next time you heard him on,
>work someone else.

And you add to the fever by writing this stuff. Now everyone wants to work
Jim to see if he's really as bad as all the netters portray him to be.
You're his publicity.

I'm not an advocate of the guy, but I'm not a detractor either. I've never
had any trouble working him in any pileup, and frankly every time I've heard
him he's been quite entertaining. What more could you want? :-)

Does anyone out there in net-land know who handles Jackson Brothers
dial drives? Are they still in business? My last catalog is from 1974,
when SWEDGAL ELECTRONICS in NYC handled their line.

Any help appreciated.   Thanks

yanaa:

I've got two 70 cm yagis and i wonder what would be
the best stacking distance, with maximum gain in mind.

The antennae (:-)) are made according to the schema
in ARRL antenna book:
70 cm, 15 elements each, boom len about 3 meters.

Thanks for any advice,

In regard to all the postings about MFJ and V31BB, here is my 2 cents worth. I have only two MFJ products: 1) MFJ-102 digital clock 2) MFJ-815B SWR bridge/wattmeter. I have had the clock many years and it keeps exceptionally good time to within a second or so a month. The wattmeter was purchased this January at a local hamfest. After reading all the articles about MFJ quality, I looked inside the unit. It is rather well put together and all the solder joints look OK, not too sloppy. It is neat and looks like they do have some quality control. Also, their guarantee is for one full year; not bad on the average. It works well so far -- I run barefoot.

As to V31BB, he must, indeed, have been contacted by the government agency in Belize regarding his diatribes against MFJ. I last listened to him about three weeks ago and he was ranting on about being told he could no longer mention "the company's name" on the air. He did not do so and I was curious about which company and what he was talking about. After reading the news net here I found out.

As to his being a jerk, he certainly is! The best advice was offered here today, I think, or yesterday. That is to just ignore him. He is not the only ham in Belize and people like him give the hobby a bad name. Without anyone to listen to him I am sure he will eventually go away. People like him feed on reaction and attention. However, if anyone wants to volunteer to engage him in a rag chew during a rare DXpedition, go ahead. That will make sure he does not become a "policeman" on the DX station's frequency -- he seems to be a good candidate for the job.

Remember, DXing is fun, but missing a rare one will not REALLY change your life. There are enough, the vast majority, of good hams to still make this the best hobby there is! One contact with a really nice person makes up for a lot of V31BBs. My contact with JY1 made up for all the jerks I have every run across, almost.

>I used to work for Texas Towers as Sales/Service Manager,

Great! Someone who can answer questions that I've wondered about for years! Texas Towers is the firm that has the centerspread ads in CQ every month, right? (If not, ooops, my apologies, insert foot in mouth and hop away... :-) But, assuming I'm remembering right and it is...

1) Why does this company have different reader-service numbers for different pages of its multi-page ad?

2) Why does it have reader-service numbers at all? I've circled numbers on those ads on the CQ bingo card on and off many times over the years, and I have *never* gotten a single piece of literature or a flyer or a catalog from that company. If there is a management decision to not respond to reader-service inquiries, why don't they use the "send all inquiries directly" option CQ offers instead of having numbers?

I've tried various techniques -- picking the number from one page and circling that some months and other months circling all the numbers from all pages. Ignoring the ad for months and then circling the number. Circling all numbers every month for several months in a row. No style ever seems to trigger the company into sending anything out. In recent months I tend to just ignore the ad after this history...

In addition to answering the above specific queries, any comments you care to offer on reader-service inquiries from the vendor side will be appreciated.

Regards, Will

I'd like to set up a 10 meter 5W beacon.
I have a couple of questions regarding 10m beacon operation:

1) Is there a currently-available/easy-to-modify-to-10 meters CB tranceiver on the market? Or other such quick-and-simple xmitter?

2) How do I register the beacon to make it official on the beacon roster?

3) What do hams typically use for the ID'er? I've heard some long-winded ID'ers out there on some of the beacons.

Any beacon jocks out there?

Thanks,

Charlie Thompson

[followups to news.groups. crossposted to s.e r.h-r for technical reasons, r.r.s because of satelite discussions]

Since there has been no further discussion, I think it is not sacreligious to bump up the vote.

CHARTER: REC.ARTS.TV.CABLE

This group is for discussions pertaining in general to cable television, and satelite television. Broadcast only issues should go to rec.arts.tv. More specifically, discussions of technical, regulatory, programming, and/or customer service/cost/quality issues are welcome.

Technical discussions of cable programming technology are welcome, which is somewhat at odds to its placement in "rec," but this is proposed simply because of the infeasability of placing the group elsewhere. The original name rec.arts.tv.catv was objected to by several because of the confusion over the designation "catv" meaning community access TV instead of community antenna TV. Several have objected to placing the group in rec.arts, but there have been no alternative suggestions.

The newsgroups line would read:

rec.arts.tv.cable Discussion about cable and satelite television

This newsgroup would not be moderated. It distribution would be world-wide.

To vote, send mail to:

uop.edu!quack!vote-no   for no votes
uop.edu!quack!vote-yes   for yes votes

A daemon will pick out the "From:" line and add it to a file. No reply will be sent. Second call with vote list will be posted Tuesday the 2nd, and third call with vote list will be posted Tuesday the 9th.

The vote will end April 16, 2359 UTC, with the usual 5 day wait for late mail.

Any personal mail may be sent to ...quack!mrapple, but votes sent there will not be counted. Posted votes will not be counted.

I am researching the NBS Frequency and Time Broadcast Services and need some literature reference sources. I have a copy of the NBS Special publication No. 236. It's about 15 pages long and talks at length about getting WWV and using it to set your clocks and check your freq.

I'd like to get some more information on it, such as the history of it and its usefulness. Send mail to me and I will summarize for the net.

I seem to recall a discussion about this and the Heathkit clock designed to receive WWV over the summer. If anyone has a copy of any of it, I'd appreciate it if you'd send it to me.

Thanks!

You need to get VHF Communications which is an English translation of
a German ham magazine, with 100% technical content. Available
in this country thru Timekit in Ohio.

For several reasons, not the least of which the ARPA gateway here has been
not been operating here, I have not had the pleasure of reading Info-Hams
for at least 6 months.
I was totally amazed to find that just like the soap operas I hadn't missed
a thing. Only the names have changed (presumaably to protect the innocent)
Rather cunning name changes have been made "code-nocode" has been changed
to "increasing CW speed"....subtle   Huh
Although I did notice that in several notes some people forgot the name
change and still called it "code-nocode".... got to to watch those name
changes.......
I see we are still modifying HT's for out of band listening, and

transmitting into dummy loads etc. and even still getting into trouble on airplanes with them.
What's the new name of the 220 MHZ discussion or did it dry up.....

If it sounds like I'm cynical it's probably because I am, it's just that it's getting tougher to sort out the real gems and useful information from all the chaff (I'm being polite here) that's flowing downhill.

Cheers and 73's Geoff Williams G4JJO

Alternatives to code test:

Novice: eat 5 bunches of brocolli
Tech: eat 5 bunches of brocolli
General: eat 13 bunches of brocolli
Advanced: eat 13 bunches of brocolli
Extra: eat 20 bunches of brocolli

Of course for some people this is easy to do, but it certainly takes a lot
of dedication, and will help keep out the riff-raff.

Anyone for CHINESE FOOD at the Dayton Hamfest?

Ethically speaking, I personally don't see anything wrong with it...

but...

as I interpret the rules, you would be bringing up the transmitter back at home from your car. That constitutes REMOTE CONTROL. All transmitters under remote control must be controlled by means of either "wire line" (i.e. a phone line, etc.) or by means of a station in AUXILIARY OPERATION. The legal CONTROL POINT would be at the car. That's where you would be able to shutdown the transmitter from should you discover it to be in violation of the rules. My guess is that the FCC wants this communications to be reliable and so requires that all auxiliary operation be limited to frequencies above 220.5 Mhz except 431-433 and 435-438 Mhz. These might change when the 220-222 loss finally happens.

So as long as the transmission from the car to the house is on an auxiliary frequency, then it could be ok, legally.

REMOTE CONTROL of a station is authorized for REPEATERS and I think BEACON stations (I have to double check on beacons, but they don't apply here anyway). A plain patch is just an ordinary station conducting third party traffic (don't forget about the third party traffic rules).

You might be able to turn it into a true repeater. You'd have to make sure that BOTH the input and output are in the repeater subbands of the respective bands. It would have to qualify as a repeater under the repeater rules. Then it can be operating under AUTOMATIC CONTROL and the phone patch can be attached as a extra feature.

How about a survey that breaks up the favorite modes in terms of bands?

1. What is your favorite mode(s) on HF
2. What is your favorite mode(s) on VHF
3. What is your favorite mode(s) on UHF

Since the no-code license is only addressing privileges above somewhere between 30 Mhz and 220 Mhz (depending on which one you look at) I would think the VHF and UHF distribution to be far more important relative to having no code requirement on a class giving only those privileges.

How about?

I have an inoperative Johnson Viking 4740 CB/SSB radio.
It is 40 channels. It has no receive audio at the present time.
I am in need of a schematic/PC layout for the radio so I can get
running so I can convert it to 10 meters. Anyone having any
info, please contact me at:

Chris Crosby KA2RAF
P.O.Box 1286
Lakewood, NJ 08701

In article <26992@ut-emx.UUCP> trey@ut-emx.UUCP (Trey Garlough) writes:
>I don't see V31BB as being much different from those "phone in and be
>abused" type talk-radio shows where the DJ sits around and harangues
>the callers.  The funny thing is that people sit around and listen
>to this stuff for hours and let themselves get all steamed.

One of the intents of Amateur Radio is to "foster international goodwill".
On the bands, one does not expect to be yelled at or insulted.  V31BB
is in a postion, living in an exotic location, of having lots
of stations that would like to work him.  He compounds the situation by
working contest-style pileups -- people dying for a Belize QSL. Most of
his victims think they are talking to Joe DX station -- and then they
get slapped.  This is enough to get most people steamed.

With a talk show, you know what you're getting into, and you're basically
paying to get abused.  With a pileup, you should be able to at least get some
courtesy  -- its in the charter of Amateur Radio.  Amateur Radio is having
a tough enough time with image as it is - without V31BB.

Has anyone thought about collecting all the articles written on this gentleman via this network and sending them all at once?

I suppose that the infamous recognition might fan the flames of this individual, but it is a pleasant thought.

Heck... he might even send you a QSL! (Joke please... not serious)

Which brings up the topic of "self-policing", something that seems to be on the mind of a lot of people now-a-days. Obviously that term is a joke. The proof of that is in what is happening on our bands today.

Maybe I am daydreaming, but it seems to me that the MAJORITY of hams are disturbed or down-right disgusted at a lot of the behaviour that is going on in our spectrum. The ARRL says that a ham must NEVER jam someone intentionally (so does the FCC), and if you want to get down to brass tacks.... putting a pin in a licensed hams coax is a felony, as is beating the tar out of him at a local hamfest. So I am getting a little short on patience when I read people like Wayne Green saying that WE as HAMS are FAILING at our jobs of "self-policing" because we are too "whimpy". I hear all the accusations, but I sure don't see any valid suggestions on how to stop it.

Mr. Green has a strong medium that he could use to help stop this by simply having a "Lid of the Month" award. We could have write in votes and he could publish the results! But of course he would then probably get SUED, and he is too "whimpy" to risk that!

No... I do not like being called a "whimp". I also don't like people that print up great suggestions for where we as a Amateur Service should be headed, but don't give too many details on how to get there. Sure, you first have to define a GOAL, but I think we're all aware of some pretty good ones to shoot for... it's in how to GET there that really poses the problem.

IMHO the conduct of ham radio operators, and improving same.... is a lot more important... or at least AS important as a code/no-code license.

"Self-Policing"...In ham radio that is a GUN that has NO ammunition, unless you are willing to break the law or compromise your own ethics to make an impact.

I am interested in anyones opinion on this. My personal feeling is that the war on the crazy people has to get personal. Names have to be named and callsigns included. The really worst offenders have to be put on a hit list of every ham so that whenever they hear the persons callsign, they will know that THIS guy is a real turkey. Yes, this could drive such mentalities into rash behaviour such as jamming the local 2 meter repeater.... but then it is HIM that is breaking the law, and then HE is the one that can be prosecuted.

V31BB has been put on MY hit list, and while the internet probably isn't

a good place to keep such a database :-) it is a good example of what I
am talking about.

Since CW is not a "good filter" for nut cases, how about filling me in
on how to go about stopping this mess? I believe that it is getting
worse.   Quickly.

Whew... this was pretty strong....I can feel the heat already! :-)

In INFO-HAMS Digest V90 #303, Bob, W3OTC comments on the new proposed
United Kingdom callsign allocations, and says::
>
>Who said that the American callsign scheme is complicated ??????
>
I *LIVE* in the UK, and may have to *PUT UP WITH* this farce of a scheme
for assigning new calls....... {start playing of sad violin music...}
The need to have a seperate call series for club stations passing third-party
messages(!) seems obscure and unnecessary to me, add this to the confusion
that the new 'novice' license will introduce, and i predict chaos! (BTW,
why do we need a 'novice' license? we already have one - its called the
'Class 'B'', no-code license - gives us six meters and up, full privileges).
I feel that the proposed call scheme is nothing more than the uninformed
scribbling of incompetent buffoons, and have written to RSGB expressing
my strongest disapproval of the new proposal. But i feel that i am a
lone voice crying in the wilderness...

Normally - I feel politics and Amateur Radio have no real common
ground - especially here on Info-Hams. However in this case I must make
an exception since what happened this week in Israel just might be the spark
that can eventually lead to peace in the Middle East - or at least a beginning
of something...
On March 27th, it was announced by the Ministry of Communications that Amateur
Radio operators can now legally communicate with 22 Arab countries that were
formally forbidden under the rules and regulations since 1948.
So far, nothing has been said formally on the part of our neighbors - but it
is too soon to tell. Jerusalem and Amman for example are in 2 meter repeater
range. 40 meter SSB operation during the day would give coverage into many
neighboring countries.(It would be nice to hear JY1 pop on to the Jerusalem
repeater on his way to work!)
Things happened in Eastern Europe recently after no one thought it was
possible... Why not here ?
Peace via Amateur Radio ??
This may be a real first...
